Descriptors: *Aquatic environments, *Ecosystems, *Radium radioisotopes, *Uranium radioisotopes, Rivers, Mills, Colorado, Wastes, Biological communities, Sediments, Biota, Fish, Utah, Algae, Insects, Invertebrates, Background radiation, Flocculation, Pollutants, Sampling.
Identifiers: Animas River, Durango, San Miguel River, Dolores River, Uravan, Cottus spp, Rhinichthys osculus, Suckers, Ictalurus punctatus, Trichoptera, Odonata, Ephemeroptera, Plecoptera, Diptera, Coleoptera, Hemiptera, Mollusca, Raffinate, Thorium, Tailings.

Radium-226, in uranium processing wastes, seriously affects stream biota. Its accumulation in biotic components was followed for three years. The Animas River, Colorado, after diversion of the most toxic of a mill's effluents, showed excellent recovery biologically. Water, sediment, algae, invertebrates, and fish, were sampled above and below mill sites. Comparison of background levels and radium accumulation showed differences in uptake by various fish species. A concentration factor (the ratio of the concentration of a particular

LIBRARY U. OF L. URBANA-CHAMPAIGN

radionuclide in the organism to its concentration in the aqueous medium) showed the mean radium-226 content decreasing with downstream distance. During the last two years, radium content of sediments averaged only about three times background levels, earlier samples contained up to twenty times, while still earlier work indicated up to several hundred times the background levels of radium-226. The San Miguel-Dolores River system was in poor biological condition due primarily to chemical pollution from a uranium mill. Biota samples contained increasing amounts of radium-226 as distance below the mill increased, although radium-226 content of the water and sediments decreased with distance. Apparently organisms could not survive long enough in the upper pollution zone to accumulate the amounts of radium-226 which might otherwise be found. ECOLOGY OF TWO POPULATIONS OF AN AQUATIC ISOPOD (LIRCEUS FONTINALIS RAF.), WITH EMPHASIS ON IONIZING RADIATION EFFECTS,
Emory Univ., Atlanta, Ga. Dept. of Biology.
C. E. Styron.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 53-60. 2 fig, 2 tab, 32 ref, disc.

Descriptors: *Ecology, *Isopods, *Radiation effects, Environmental effects, River basins, Background radiation, Ecosystems, Granites, Temperature, Droughts, Biological communities, Age, Maple trees, Herbicides, Silts, Dragonflies, Salamanders, Crayfish, Insects, Larvae, Behavior, Life cycles, Georgia.
Identifiers: Lirceus fontinalis, DeKalb County (Ga), Mount Arabia (Ga), Lullwater Creek (Ga), Mutation rate, Beech-maple stands, Physiology, Taxonomy.

Results are reported of comparative study of isopods' biological reactions to various environmental stresses, including ionizing radiation, as well as extending and testing previous biometrical conclusions relative to environmental tolerances. In DeKalb County, Georgia, two populations of Lirceus fontinalis are isolated from each other in separate river drainages and are evolving in response to different environmental stresses. Background radiation counts from naturally occurring radionuclides in granite at Mount Arabia is several times above average for terrestrial ecosystems. Drought and high temperatures apparently are the main ecological factors limiting population on Mount Arabia. These factors are unimportant to the population in Lullwater Creek, where biotic factors have primary ecological significance for Lirceus. On Mount Arabia, tolerances to gamma radiation and drought stress increase significantly with age of Lirceus, which are 7.88 times more tolerant to ionizing radiation stress and 5.36 times more tolerant to drought stress than those of Lullwater Creek. Differences in reactions between Lirceus of Lullwater Creek and Mount Arabia to acute gamma radiation, temperature, and drought stress, may have developed during evolutionary period in response to diverse selection pressures. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)

EFFECT OF SUBLETHAL GAMMA IRRADIATION ON THE IRON METABOLISM OF THE PINFISH, LAGODON RHOMBOIDES,
Bureau of Commercial Fisheries, Beaufort, N. C. Radiobiological Lab.
David W. Engel.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 152-156. 3 fig, 1 tab, 13 ref.

Descriptors: *Gamma rays, *Iron, *Metabolism, Blood, Radioactivity, Spectrometers, Size, Sea water, Fresh water, Mammals, Volume, Distribution.
Identifiers: *Pinfish, Kidney, Spleen, Liver, Beaufort Radiobiological Laboratory, Tench, Lagodon rhomboides, Detector.

The hematopoietic system of fish, in contrast to that of mammals, has not been investigated extensively. The effect of acute irradiation of iron metabolism of the pinfish, Lagodon rhomboides, was investigated by measuring specific activities of injected iron-59 (Fe-59) in the blood and tissues of irradiated and unirradiated fish. The radiation dose of 2000 rads markedly disrupted iron metabolism, and affected the distribution of Fe-59 in blood, liver, spleen, and kidney, at different times after irradiation. Decreased specific activity of the blood of irradiated fish for more than 22 days indicated depressed erythrocyte production; increased specific activity above the level of the controls on the 36th day indicated recovery of erythropoiesis. Radiation altered the size distribution of blood cells and the cell volumes, both effects indicating that larger and younger cells were being released into the circulation from 14-28 days after irradiation. Postirradiation changes in specific activities of kidney and spleen suggested that the kidney was the major erythropoietic organ and that the spleen had no more than a minor role in erythrocyte production. Changes in the specific activity of the liver suggested that it functioned only in iron storage and mobilization. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)

INTERACTING EFFECTS OF GAMMA RADIATION AND SODIUM HALIDE CONCENTRATIONS ON RAINBOW TROUT,
Utah State Univ., Logan. Ecology Center.
John M. Neuhold, and R. K. Sharma.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 142-151. 9 fig, 3 tab, 15 ref, disc.

Descriptors: *Cesium, *Gamma rays, *Rainbow trout, *Sodium chloride, *Sodium compounds, Time, Oxygen, Habitat, Water, Arid climates, Nuclear explosions, Radioactivity, Temperature, Monitoring, Fluorometry, Chemical properties, Calcium, Magnesium, Mortality.
Identifiers: Excretion, Muscles, Dose levels, Causal interactions, Concentration effects, Osmoregulation, Ion uptake, Ion loss.

Research objective was investigation of effects of gamma ray doses and halide concentrations on rainbow trout survival. Water temperature was maintained at acclimation temperatures and oxygen concentration close to saturation. Fish were irradiated in a cesium-137 (1320 curies) gamma source. After radiation exposure, fish were transferred to experimental units, each with a concentration of sodium halide. Mortality of such irradiated rainbow trout in aquaria, subjected to medium levels of sodium fluoride, sodium chloride, sodium bromide, and sodium iodide, displayed statistically significant responses to following interactions: time by gamma dose, time by sodium halide concentration, or gamma dose by sodium halide concentration. These interactions, apparently caused by radiation, induced changes in oxygen uptake, and in sodium uptake and excretion. Evidence seems to warrant the surmise that mortality early in the experiment resulted from low calcium. The probability that osmoregulatory function is damaged with radiation dose is accepted as an explanation for the pattern of fish mortality in differing salt concentrations. Differential dam
to exchange tissues as well as to gill and renal
sues could cause apparent interactions betw
dose and time or concentration. (See also Vol
No. 18, Field 5C, W69-07441) (Jones-Wisc)

Probe, Hanford (Wash), Half-life.

Because radioactivity concentrates in sediments
study of this phase was made of the Columbia Ri
estuary. Surface layer of sediments, contain
most of the man-made radionuclides, is difficult
remove in its undisturbed state, in quantities su

; for radioanalysis. An in situ probe circum-
s these problems, making possible rapid data
ction allowing quick assessment of radioactivi-
stribution. Radioactivity thus measured closely
esponds with that which benthic organisms ex-
ence. Chromium-51 and zinc-65 had the
est concentrations of the radionuclides
tified, although naturally occurring potassium-
as ubiquitous while cobalt-60 and manganese-
were prevalent. Sediment radioactivity ex-
ed an order of magnitude higher than that of
vater, subjecting benthic organisms in this sedi-
to a considerably higher radiation dose than
lankton or nekton living in the water above.
ibution of sediment radioactivity (fine sedi-
s contain highest concentrations) depends on
ontact with radioactive water, (2) the current
ne set up by river flow, tidal action, and estua-
ape, (3) flocculation of colloidal suspension
contact with ocean water, (4) sediment parti-
ze and composition, and (5) chemical form of
adionuclide as modified by its immediate en-
ment. (See also Vol. 2, No. 18, Field 5C,

al effects, Ponds, Springs, Sinks, Autoradio-
hs, Environment, Sunfishes.
ifiers: *Lepomis macrochirus, *Blood, *Flesh,
ake, Half-life, Bones, Scales, Concentrations,
e crappie, Excretion patterns.

ostrontium in fish flesh is important. The rapid
l uptake of radio-strontium by bluegills
omis macrochirus) was attributed to a quickly
anged strontium (Sr) pool in flesh and blood.
r pool in blood consisted of a component hav-
biological half-life of 2 hours. Another 1% of
d Sr exchanged in 35 days and 97% was con-
d in a component with a long, undetermined
gical half-life. Strontium in blood contributed
han 0.09% to Sr in flesh. At least three com-
nents of Sr metabolism were identified in flesh.
Sr in flesh was turned over with a biological
life of about 2 hours, while 9% was turned over
a half-life of 9 days. Remaining 90% of Sr in
had a long but undetermined half-life. Uptake
in the quickly exchanged Sr pool was directly
ortional to Sr concentrations in test solutions
nge 0.3-300 parts per billion (ppb). At 3,000
30,000 ppb Sr, bluegills took up more Sr than
wer concentrations, indicating non-discrimina-
against Sr at abnormally high environmental
entrations. (See also Vol. 2, No. 18, Field 5C,

Descriptors: *Biota, *Columbia River, Chromium, Phosphorus radioisotopes, Trophic level, Zinc radioisotopes, Iron, Sediments, Fish, Radioecology, Effluents, Ecosystems, Plankton, Algae, Periphyton, Invertebrates, Adsorption, Phytoplankton, Suckers, Shiners, Caddisflies, Temperature, Flow, Diatoms, Manganese.
Identifiers: *Hanford (Wash), *Reactor, Radionuclides, Assimilation, Ba-La, Half-life, Ptychocheilus oregonensis, Acrocheilus alutaceus, Ulothrix, Cladophora, Prosopium williamsoni.

Closure of the Hanford reactors for an extended period caused rapid and extensive decline in concentration of radionuclides. Chromium-51 (Cr-51) and phosphorus-32 (P-32) decreased two to three orders of magnitude in lower trophic levels. The rapid change of P-32 was probably due to its relative short physical half-life and its rapid turnover in aquatic organisms. This was chiefly a biological process, not merely surface adsorption. Although Cr-51 was abundant, its low concentration in higher levels indicates its minor biological importance. Its relatively high concentrations in plankton, algae, and invertebrates, was probably due to adsorption rather than assimilation. Declines in concentrations of zinc-65 (Zn-65), manganese-54, and iron-59, were much less. Their lesser decline in biota as opposed to river water suggested that these nuclides either are turned over at a very slow rate in the organisms, or that they were available from parts of the ecosystem other than water. In fish P-32 was lost rapidly, Zn-65 slowly. The slower rate of change of radionuclides by fish indicated difference in uptake routes. Near equilibrium concentrations of radionuclides in most river organisms were approached within two or three weeks after resumption of reactor operation. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)
W69-07853

CESIUM, CESIUM-137, AND POTASSIUM CONCENTRATIONS IN WHITE CRAPPIE AND OTHER CLINCH RIVER FISH,
Oak Ridge National Lab., Tenn. Health Physics Div.
D. J. Nelson.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 240-248. 5 tab, 23 ref, disc.

Descriptors: *Cesium, *Radioisotopes, *Radioactivity, *Fish, *Potassium, *Tennessee, Drums, White bass, Channel catfish, Seasonal, Strontium radioisotopes, Gamma rays, Spectrometers, Perches, Trophic level, Pikes, Bullheads, Marine fish, Sunfishes.
Identifiers: *Pomoxis annularis, *Clinch River (Tenn), *Concentrations, Biosphere, Environmental pathways, Biogeochemical, Calcium, Half-life, Flounder, Internal organs, Dorosoma cepedianum, Micropterus salmoides, Lepomis macrochirus, Crappies.

Concentration factors are a convenient parameter to compare biogeochemical relationships. Potassium (K) concentrations in white crappie were relatively constant throughout the year and all specimens averaged 3.48 milligrams/gram fresh weight. Other species, including drum, white bass, channel catfish, bluegill, contained similar K concentrations, and the K content was considered a conservative property. Cesium (Cs) concentrations in white crappie flesh were about 0.008 microgram/gram fresh weight from May through July, and during the remainder of the year varied from 0.010 to 0.018 micrograms/gram. In addition to seasonal variations, the Cs content of different species ranged from 0.00344 micrograms/gram in bluegill to 0.0160 in white bass. Concentration factors for K were from 2500 to 2700, while those for Cs were from 140 to 640. The average specific activity of Cs-137 in white crappie flesh was about the same as the average specific activity in Clinch River water. These results showed that specific activities of Cs-137 may be used to predict its concentration in fish for chronic releases of Cs-137 to surface streams. The variable Cs content and the constant K content of fish vitiates application of Cs-137 to K ratios for predictive purposes. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)
W69-07854

ACCUMULATION AND DISTRIBUTION OF Mn-54 AND Zn-65 IN FRESHWATER CLAMS,
California Univ., Livermore. Lawrence Radiation Lab.
Florence L. Harrison.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 198-220. 18 fig, 7 tab, 17 ref, disc.

Descriptors: *Clams, *Fresh water, *Manganese, *Radioisotopes, *Zinc radioisotopes, *Distribution, Water, Temperature, Size, Radioactivity, Gonads, Nuclear explosion, Retention, Spectrometers, California.
Identifiers: *Accumulation, Half-life, Calcareous tissue, Digestive tract, Muscles, Excretory organs, Mantle, Gills, Removal, Concentration, San Joaquin River (Calif), Sacramento (Calif), Detector, Labial palps, Foot, Body wall, Body fluid, Lawrence Radiation Laboratory, Heart, Kidney, Uptake, Loss.

Accumulation and distribution of manganese-54 and zinc-65 in freshwater clams was followed for 147 days in an aquarium system designed to maintain constant concentrations of manganese and zinc. Amounts of the radionuclides increased linearly during the uptake period. Concentrations of manganese-54 and zinc-65 showed variation from tissue to tissue, but concentrations within a given tissue were equivalent. After about 100 days, steady-state accumulation and loss were reached in digestive tract, gonad, muscles, and excretory organs. However, in calcareous tissue, mantle and gills, steady-state conditions were not reached in 147 days. Rates of accumulation were found to depend on concentrations of stable element in water, temperature, and sizes of animals. Loss rate of stable element from the clam body was slow: the large long-lived pool of manganese having a half-life of about 1300 days; that of zinc, 650 days. Measurements of specific activities indicated that in all parts of the body, a large fraction of manganese and zinc was in pools with which the radionuclides did not exchange. The main storage site in the body for manganese and zinc (as well as calcium) was in granules in the calcareous tissue. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)
W69-07855

CONCENTRATION OF SODIUM BY FRESH WATER TURTLES,
Pennsylvania State Univ., University Park. Dept. of Biology.
William A. Dunson.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 191-197. 3 fig, 2 tab, 14 ref, disc.

LIBRARY U. OF L. URBANA-CHAMPAIGN

Food has been considered to be the primary route of electrolyte uptake in aquatic turtles. Recent investigations of ion fluxes in freshwater turtles (Trionyx and Pseudemys) indicate there can be a significant uptake of sodium (Na) from the environment by means of active transport. Influx measurements in the intact animal and studies of membranes in vitro in an Ussing cell indicated that transport was localized in membranes of the oral and cloacal regions. Na uptake is an important feature of the adaptation of these animals to fresh water, particularly in areas with cold winters. Hibernating turtles in the laboratory or in nature lose large amounts of Na which must be replaced upon emergence by feeding and by active uptake of ions. The mechanism of uptake also appears to be of general use at other times of the year, especially when food intake is reduced. Toxic effects of zinc seemed evident. Freshwater turtles have developed mechanism for Na uptake very similar to ion transport systems found in fish and amphibians. In light of this and their long evolutionary history in aquatic habitats, turtles should be studied further to determine their importance in concentration of dissolved radioisotopes. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)

CESIUM-137 IN SOME COLORADO GAME FISH, 1965-66,
Colorado Dept. of Game, Fish and Parks; and Colorado State Univ., Fort Collins. Dept. of Radiology and Radiation Biology.
Wesley C. Nelson, and F. Ward Whicker.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 258-265. 2 tab, 23 ref, disc.

Descriptors: *Cesium, *Radioisotopes, *Fish, *Colorado, Reservoirs, Lakes, Streams, Elevation, Depth, Conductivity, Potassium, Sunfishes, Trout, Salmon, Climates, Soils, Limnology, Physiological ecology, Biological properties, Ecosystems, Latitudinal studies, Precipitation (Atmospheric), Alpine, Rainbow trout, Brown trout, Cutthroat trout, Brook trout, Lake trout, Fallout, Nuclear explosions, Deer, Temperature, Plankton.
Identifiers: Muscle, Area, Pomoxis nigromaculatus, Plains, Foothills, Physiography, Half-life, Lepomis.

During 1965-1966, cesium-137 (Cs-137) concentration in eight game fish species from Colorado waters varied from non-detectable (less than 50) to 5800 picocuries/kilogram. Waters sampled included 3 plains, 2 foothills, 5 montane and 12 alpine reservoirs, lakes, and one plains stream. Elevation of these waters varied from 1538-3498 meters; lake depths, from 1-45 meters; lake areas, from 1.4-230 hectares; lake watershed areas, where measured, from 53-2480 hectares. Conductivity of waters varied from 8-1700 micromhos; potassium concentration, from 0.1-10.3 parts per million. Based on six samples, Cs-137 concentrations were from 2-7 times greater in 1965 than 1966. In general, sunfish, crappies and trout sampled from plains and foothills reservoirs, lakes, and the river contained little or no Cs-137. Trout and salmon from a montane reservoir and one lake contained low or moderate concentrations of Cs-137, whereas those from another montane lake had high concentrations. Trout from alpine lakes and reservoirs contained moderate to high concentrations of Cs-137. Cs-137 concentrations in fish from different waters varied chiefly according to climatic, edaphic and limnological conditions; between species, such concentrations varied with differences in biology and physiology of the species. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)

RADIOACTIVE AND STABLE STRONTIUM ANALYSIS OF UPPER MISSISSIPPI RIVER CLAMSHELLS,
Saint Mary's Coll., Winona, Minn. Dept. of Biology.
George Pahl.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 234-239. 2 fig, 3 tab, 13 ref, disc.

Descriptors: *Strontium radioisotopes, *Mississippi River, *Clams, *Fresh water, Benthic fauna, Fallout, Monitoring, Calcium carbonate, Nuclear explosions, Rain, Spectrophotometers, Indicators, Nutrients, Environment, Milk, Wheat, Soils, Minnesota.
Identifiers: Strontium carbonate, Shells, Half-life, Biosphere, Bones, Teeth, Lake Pepin (Minn), Stratosphere, Tap water.

Freshwater clams form a significant portion of the benthic fauna of the Upper Mississippi River biological community. Evidence indicates that they may serve as ideal biological monitors of strontium-90 (Sr-90) concentration not only in the Upper Mississippi River but also of worldwide fallout of this radionuclide. Advantage was taken of the fact that shells of the long-lived clams of this area are composed of distinct annual layers and are chemically composed of calcium and/or strontium carbonate almost exclusively. Shells of live clams of genus Lampsilis collected at end of the 1962-4 growing season were analyzed for both stable and radioactive strontium. Shell layers formed over the ten-year period, 1955-64, showed stable strontium to be consistently 10 orders of magnitude greater than that of radioactive strontium. During this time, stable strontium increased by a factor of only 2, while the Sr-90 increased by a factor of 7. This rise of radiostrontium, while not corresponding with overall strontium increase, did correlate closely with the fallout pattern associated with nuclear weapon testing carried out during this period. Results compare favorably to similar analyses of fallout. (See also Vol. 2, No. 18, Field 5C, W69-07441) (Jones-Wisc)
W69-07858

A TRACER EXPERIMENT WITH I-131 IN AN OLIGOTROPHIC LAKE,
Helsinki Univ. (Finland). Dept. of Radiochemistry.
S. Kolohmainen, S. Takatalo, and J. K. Miettinen.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 278-284. 6 fig, 2 tab, 11 ref, disc.

Descriptors: *Oligotrophy, *Lakes, *Iodine radioisotopes, *Tracers, Ecosystems, Algae, Water analysis, Temperature, Depth, Humic acids, Zooplankton, Perches, Bogs, Pine trees, Fir trees, Cesium, Oxygen, Mud, Rainbow trout, Fallout, Nuclear explosions.
Identifiers: *Finland, Spongilla lacustris, Sphagnum recurvum, Nephar lutea, Cyprinus carassius, Oedogonium, Dysoligotrophy, Bottom animals, Heath, Analyzer, Half-life, Concentration factor.

A tracer experiment with iodine-131 in a natural oligotrophic lake was carried out to provide quantitative information on distribution of this fallout nuclide in all components of a natural ecosystem. Iodine-131 (17 millicuries) was pumped from a moving boat and efficiently mixed within 100 minutes into the lake of 23,000 cubic meters. Samples of water, plants, a sponge, and three species of fish, were collected during 41 days. Results showed that peak radioactivity was reached in all organisms: algae, water plants, a sponge (Spongilla lacustris), and fish (crucian carp (Cyprinus carassius), perch (Perca fluviatilis), rainbow trout (Salmo gairdneri)), within 5 to 7 days. The effective time of radioactivity in the lake water was 6.5 that of the added element, iodine, 36 days. factor in removing iodine from the water wa moss (Sphagnum). Concentration factors c lated by comparing the peak radioactivity of th ganism to the initial radioactivity in the water (nocuries/killogram fresh weight per nann ries/liter water) were: sponge 200, green algae moss 90, water lily (Nuphar luteum) 60, cr carp 25. The animal species showed the lo biological half-lives for iodine. (See also Vo No. 18, Field 5C, W69-07441). (Jones-Wisc)

CESIUM-137 IN FRESHWATER FISH DUR 1954-1965,
Division of Biology and Medicine (A Washington, D. C.
Philip F. Gustafson.
Available from Clearinghouse as CONF 67 at,3.00 in paper copy and $0.65 in microf Symp on Radioecology, Proc 2nd National S May 15-17, 1967, Ann Arbor, Mich, Ne Daniel J and Evans, Francis C (eds). US At Energy Comm, Doc CONF 670503, pp 249-2 fig, 2 tab, 6 ref, disc.

Descriptors: *Cesium, *Freshwater fish, *Fal Perches, Walleye, Spectrometers, Minne Gamma rays, Ecosystems, Bottom sedim Trophic level, Sinks, Sampling, Birds, Plan Scaling, North Dakota, Wisconsin, Nuclear e sions, Precipitation (Atmospheric), Radioactiv Identifiers: Half-life, Body burden, Deposition gonne National Laboratory, Contamination, Lakes (Minn.

Concentrations of cesium-137 (Cs-137) world-wide fallout have been measured in perch and walleyes by gamma ray spectrom Annual collections were made during each (1954-1965) from the same approximate loca Deposition rate and total accumulation of Cs in the area were derived from regional dat making corrections for differences in precipitation. Cs-137 levels changed fairly ra in response to changes in fallout rate; how there was a substantial contribution from acc lated deposition in the aquatic ecosystem w acts as a sink. Solution of a mathematical ex sion relating the concentration of Cs-137 in fi the total amount of Cs-137 present in the lake its rate of deposition, indicated that 25-80% o found in fish came from the long-term accu tion. This accumulation was the more impo source for Cs-137 fish uptake during periods o fallout rate. Effective half-time for Cs-137 i lake system, as inferred from small fish, was a two-and-a-half years. Persistence of Cs-137 freshwater system differs sharply from the beh of terrestrial levels. The continuing availabili Cs-137 to freshwater fish suggests its access to human diet for some time. THE ROLE OF TUBIFICID WORMS IN TRANSFER OF RADIOACT PHOSPHOROUS IN AN AQUA ECOSYSTEM,
Western Michigan Univ., Kalamazoo.
Bert K. Whitten, and Clarence J. Goodnight.
Available from Clearinghouse as CONF 6705 $3.00 in paper copy and $0.65 in microfiche. S on Radioecology, Proc 2nd National Symp, 15-17, 1967, Ann Arbor, Mich, Nelson, Dan and Evans, Francis C (eds). US Atomic En Comm, Doc CONF 670503, pp 270-277. 2 f tab, 20 ref.

Descriptors: *Tubificids, *Ecosyst *Phosphorus radioisotopes, *Transfer, Water, teria, Sediments, Minnows, Detritus, Cy nutrients, Plankton, Algae, Invertebrates, Tu ty, Worms, Sunfishes.

tifiers: Radioautographs, Half-life, Concentra- factor, Limnodrilus spp, Aeolosoma hem- ni, Escherichia coli, Myriophyllum, Lepomis rochirus, Pimephales notatus.

umulation of radiophosphorus by tubificid ns (common habitat bottom sediments of ms and lakes) from water, bacteria, and sedi- t, was studied. Tubificid worms took up more phorus from water and bacteria than from nent. These worms were able to accumulate phorus from both soluble and organic particu- sources. Radioautographs demonstrated that h of the activity was in the tissues of these ns and not simply adsorbed. No significant ac- ulation from radioactive orthophosphate, h was adsorbed onto sterile sediments, was ob- ed. Bluegills and bluntnose minnows fed tu- id worms labelled with radiophosphorus accu- ted radiophosphorus in their tissues. Theoreti- calculations based on these feeding studies onstrated that an equilibrium was approached two weeks in the tissues of these fish and was ntained through the duration of the experiment. ficid worms, because of their abundance in e aquatic ecosystems, may have an important in transfer of radioactive phosphorus from r and detritus to other components of the tic ecosystem, such as fish. These worms ap- to function in conjunction with bacteria in the cling of radiophosphorus from detritus and ments. This experimentation is intended to sug- possible relationships which may occur in the ronment. (See also Vol. 2, No. 18, Field 5C, -07441). (Jones-Wisc)

RADIOECOLOGY.

Division of Biology and Medicine (AEC), Washington, D. C.

Proc 1st Natl Symp Radioecology, Colo State Univ, Fort Collins, Sept 10-15, 1961. Schultz, Vincent and Klement, Jr, Alfred W (eds). Reinhold Publishing Corp, New York, and Amer Inst Biol Sci, Washington, DC, 1963. 746 p, 294 fig, 261 tab, 2,476 ref, 2 bibliog.

Descriptors: *Conferences, *Radioecology, Fallout, Biological communities, Environmental effects, Ecosystems, Environment, Population, Radioactive waste disposal, Radioactivity, Radioactivity effects, Radioisotopes, Vegetation, Water pollution sources, Water pollution effects, Computer models, Colorado, Food chains, Insects, Fish, Mammals, Plankton, Oceanography, Birds, Limnology, Tracers, Bibliographies, Training.
Identifiers: *Proceedings, Animal sciences, Ecological techniques, Freshwater environments, Nevada Test Site, Marine environments, Plants sciences, Radionuclide cycling, Soil sciences, Terrestrial environments, Fort Collins (Colo).

Volume comprises proceedings of symposium organized to integrate current information in radioecology. Compendium includes text of introductory speaker, 'Impact of Atomic Energy on the Environment and Environmental Science,' and general review papers: 'Radiation Effects and Peaceful Uses of Atomic Energy in the Plant and Soil Sciences,' 'Radiation Effects and Peaceful Uses of Atomic Energy in the Animal Sciences,' 'Continental Close-In Fallout: Its History, Measurement and Characteristics,' 'Disposal of Radioactive Wastes: Its History, Status and Possible Impact on the Environment.' Additional sections (number of contributions per section in parentheses) are entitled: Cycling and Levels of Radionuclides in the Terrestrial Environment (13), Cycling and Levels of Radionuclides in the Marine Environment (12), Cycling and Levels of Radionuclides in the Freshwater Environment (5), Effects of Ionizing Radiation on Plants and Animals in Terrestrial Environments (16), Effects of Ionizing Radiation on Plants and Animals in Marine and Freshwater Environments (6), Ecological Techniques Utilizing Radionuclides in Terrestrial Environments (9), Ecological Techniques Utilizing Radionuclides in Marine and Freshwater Environments (5), Occurrence, Effect and Utilization of Nuclides in the Environment (16). Appendices include: panel report on education and research training and two bibliographies (2,452 entries altogether). Those contributions relevant to aquatic ecosystems will be abstracted separately. (Eichhorn-Wisc)

LETHAL OXYGEN CONCENTRATIONS FOR TROUT AND SMALLMOUTH BASS,

New York State Dept. of Conservation.
G. E. Burdick, Morris Lipschuetz, Howard F. Dean, and Earl F. Harris.
N Y Fish and Game J, Vol 1, No 1, pp 84-97, January 1954. 4 fig, 4 tab, 11 ref.

Descriptors: *Bass, *Environmental effects, *Lethal limit, *Oxygen, *Trout, Estimating equations, Eutrophication, Fishkill, New York, Oxygen demand, Organic wastes, Regression analysis, Temperature, Water chemistry, Water pollution effects, Water quality.
Identifiers: Beebe Lake (N Y), Deer River (N Y), Grout Brook (N Y), Hypoxic environments, Micropterus dolomieu, Rochester (N Y), Rome Fish Hatchery (N Y), Salmo gairdnerii, Salmo trutta, Salvelinus fontinalis, Winkler method.

Sensitivity of fishes to environmental hypoxia increases with rising temperature. Authors constructed curves describing this relationship for trout (brook, brown, and rainbow) and smallmouth bass by plotting mean LOC (lethal oxygen concentration) against temperature on semi-logarithmic paper and fitting the best linear regression line to the plot. They determined LOC by a procedure involving gradual respiratory reduction of oxygen in sealed containers, using loss of equilibrium as an end-point. Highest and lowest concentrations producing such effects were recorded. Regressions so obtained (with temperature ranges, in degrees Fahrenheit, indicated in parentheses) are as follows: brook trout (55-70), Log Y= 0.0135X - 0.54326; brown trout (49-69), Log Y= 0.01248X - 0.46056; hatchery rainbow trout (52.0-71.1), Log Y= 0.01145X - 0.55783; wild rainbows (52-68), Log Y= 0.00979X - 0.48858; Deer River smallmouth bass (54-80), Log Y= 0.00723X - 0.51936; Beebe Lake bass (52.5-80.0), Log Y= 0.00842X - 0.64366, where Y is mean LOC in parts/million, and X is temperature in degrees F. Report includes tabular data bearing on maximum, minimum, median, and mean LOC, with standard deviations and standard errors for the latter. Authors present evidence that their procedures approximate rapid decreases of oxygen in streams intermittently receiving organic wastes. (Eichhorn-Wisc)

THE SUBMERGED AQUATICS OF UNIVERSITY BAY: A STUDY IN EUTROPHICATION,

Wisconsin Univ., Madison. Dept. of Botany.
Christopher T. Lind, and Grant Cottam.
Amer Midland Naturalist, Vol 81, No 2, pp 353-369, April 1969. 4 fig, 6 tab, 17 ref.

Descriptors: *Submerged plants, *Eutrophication, Wisconsin, Aquatic plants, Bioindicators, Water pollution effects, Biological communities, Environmental effects, Floating plants, SCUBA diving, Oligotrophy, Plant growth, Biomass, Phenology.
Identifiers: *University Bay (Wisc), *Lake Mendota (Wisc), Dane County (Wisc), Madison (Wisc), Myriophyllum exalbescens, Potamogeton amplifolius, Potamogeton illinoensis, Compositional gradient (Swindale-Curtis), Ceratophyllum demersum, Compositional indices, Sand bar (Scirpus) community, Floating leaved community, Vallisneria community, Shallow submerged community, Myriophyllum-Vallisneria community, Myriophyllum community, Species frequency, Species diversity, Species density, Vallisneria americana.

Authors studied submerged aquatic plants in Lake Mendota, Wisconsin, by sampling 21 transects, extending perpendicularly from the shore to that point in University Bay where their growth ceased. All plants intercepting the line were recorded within consecutive half-meter linear segments. Data were used to construct a contour map of vegetated portions of bay and to delimit six plant communities found there. Samples collected biweekly from four quadrats provided information on plant heights and standing crops. Report includes following tabulated data: variation in depth of plant growth; species list by relative and percentage frequency; species composition and Compositional Indices for six communities; average densities by quadrat; 1922 species list; and quantitative changes (45 years) in species composition. Collected data were compared with studies made in 1922. Marked changes in vegetation have occurred, the principal differences being a great increase in Myriophyllum exalbescens, and disappearance of Potamogeton amplifolius and P illinoensis, former major components of the vegetation. Based upon a quantitative compositional gradient of 400 points, representing lakes from oligotrophic to eutrophic, this bay has reached its ultimate limit of eutrophication, and its future is apparently one of decreasing species complexity and increasing problems to human users. LIBRARY U. OF I., URBANA-CHAMPAIGN

SOME LIME-INDUCED CHANGES IN LAKE METABOLISM,
Wisconsin Univ., Madison. Lab. of Limnology.
Raymond G. Stross, and A. D. Hasler.
Limnology and Oceanography, Vol 5, No 3, pp 265-272, Nov 1964. 5 fig, 2 tab, 18 ref.

Descriptors: *Cycling nutrients, *Lakes, *Lime, Bicarbonates, Calcium, Colloids, Dystrophy, Eutrophication, Iron, Light penetration, Limnology, Magnesium, Organic matter, Oxygen demand, Phosphorus, Water chemistry, Water quality, Wisconsin.
Identifiers: *Experimental limnology, Bog lakes, Iron cycle.

Hydrated lime was applied to lakes George, Corrine, and Peter, in northern Wisconsin, utilizing Paul Lake as an untreated natural reference. These bog-type, dystrophic lakes are all slightly acid and stained with organic colloids. Light penetration increased in all treated lakes; depth of euphotic zone increased by 22% in George, 40% in Corrine, 60% in Peter. After six weeks, pH of George Lake had decreased from 9.4 to 7.2, immediately after treatment. Because lime does not remove all colloids equally well, light penetration alone may not adequately indicate change in degree of dystrophy. Lime may efficiently precipitate only more unstable colloids, whereupon oxygen demand may decrease without measurably influencing water clarity. Data included in report suggest that normal precipitation of phosphorus by iron was unaffected by treatment of Peter Lake. (Eichhorn-Wisc)

LIMITATION OF NUTRIENTS AS A STEP IN ECOLOGICAL CONTROL,
Wisconsin Univ., Madison. Hydraulic Lab.; and Wisconsin Univ., Madison. Sanitary Lab.
Gerald W. Lawton.
Trans of Seminar on Algae and Metropolitan Wastes, Robert A Taft San Eng Center, Cincinnati, Ohio, TR W61-3, pp 108-117, April 27-29, 1960. 12 fig, 3 tab, 15 ref.

Descriptors: *Nutrients, *Eutrophication, *Sewage effluents, Nitrogen, Phosphorus, Wisconsin.
Identifiers: *Ecological control, *Effluent diversion, *Diversion effects, *Madison lakes, Algal nuisance, Odor nuisance, Nutrient sources, Chemical studies, Inorganic nitrogen, Organic nitrogen, Soluble phosphorus, Volatile suspended solids, Algae sample concentration, Algae species diversification, Madison (Wis), Lake Mendota (Wis), Lake Monona (Wis), Lake Wingra (Wis), Lake Kegonsa (Wis), lake Waubesa (Wis), Biological studies.

Algal nuisance and odor problem plagueing Madison lakes for years, was first attributed (1920) to decomposition of abundant algal blooms, promoted by nutrients contained in municipal and industrial wastes. The Governor's Committee (1943), determined that Madison's sewage plant effluent contributed the bulk of nutrients to Lakes Waubesa and Kegonsa. By 1958, a 1943 legislative bill was implemented and effluent diverted via Badfish Creek to a point below the Madison lakes. From average flow of the Yahara River and the calculated volumes for Lakes Waubesa and Kegonsa, it was projected that diversion would eliminate the overenrichment rapidly; however actual reduction of this overenrichment was considerably less due to trapped nutrients in bottom muds and incomplete mixing. To evaluate effects of diversion, chemical and biological studies have been conducted since 1959, utilizing twelve data collection stations from Lake Mendota to lower Badfish Creek. Graphs of inorganic nitrogen, organic nitrogen, soluble phosphorus, and volatile suspended solids, for each lake during 1922-1959, show the effects of diversion on each parameter. Data concerning plankton species diversification during 1955-1959 show Lakes Monona and Kegonsa had no appreciable change while in Lake Waubesa, number of species increased sharply after diversion. LAKE LYNGBY SO: LIMNOLOGICAL STUDIES ON A CULTURALLY INFLUENCED LAKE,
Copenhagen Univ., Hillerod (Denmark). Freshwater-biological Lab.
Sigurd Olsen.
Folia Limnologica Scandinavica, No 7, 157 p, 1955. 63 fig, 13 tab, 310 ref.

Descriptors: *Eutrophication, *Limnology, *Lakes, Sediments, Nutrients, Aquatic productivity, Bottom sediments, Chemical properties, Diurnal distribution, Water analysis, Hydrology, Annual turnover, Vegetation, Stratification, Sewage effluents, Human population, Water pollution sources, Water pollution effects, Water chemistry, Silicon, Chlorides, Nitrogen, Calcium, Phosphorus, Oxygen demand, Oxygen, Hydrogen ion concentration, Temperature, Optical properties.
Identifiers: *Lake Lyngby So, Cultural eutrophication, Fura River, Denmark.

Situation and character of environs of Lake Lyngby So are described from the point of view of physical ancd chemical limnology, cultural history and biology. The increase in population around the lake is taken as an indicator of intensified eutrophication. Hydrology of the lake, influences on conditions of runoff and subsoil water, are mentioned, including clearing of forests and intensification of agriculture. Composition of the water changes upon passage through the lake, and chemical composition of the waters which were not directly connected with the lake differs from that of lake. Annual variation of temperature, transparency, color, dissolved oxygen, pH, alkalinity, calcium, phosphorus, silicon, chloride, nitrogen, and oxygen consumption is demonstrated with diagrams of surface and deep water samples. The occurrence of summer and winter stagnation under special conditions can be accentuated by incomplete mixing of water from River Fura. Diurnal variation, influenced by weather conditions, has been demonstrated for temperature, pH, and oxygen. The physical and chemical variations in bottom muds are illustrated. (Bortleson-Wisc)

Identifiers: *Waste water reclamation, Waste w use, South Africa.

Research results on potable water reclama from humus tand effluent and primary clar waste water are reported by the National Inst for Water Research of the Republic of S Africa. A pilot plant is described for advanced tiary treatment of waste water plant effluents. pilot plant has a 1200-gal/hr capacity and con of: (1) flotation unit, (2) ammonia stripper, (3) bilizer, (4) sand filter, (5) foam fractionator, chlorination tank, and (7) activated carbon fi Functions of the units are discussed and test re summarized. Results show that the advanced p cal-chemical treatment process can produce p ble water from humus tank effluent and prim clarified waste water at an overall cost of $0.25 $0.31 per 1000 gal, respectively. SPRAY IRRIGATION FOR THE REMOVAL NUTRIENTS IN SEWAGE TREATMENT PL EFFLUENT AS PRACTICED AT DETR LAKES, MINNESOTA,
Larson (Winston C.), Detroit Lakes, Minn.

nston C. Larson.
B SEC TR W61-3. Robert A. Taft Sanitary Engeering Center, Cincinnati, Ohio, Trans of minar on Algae and Metropolitan Wastes, pp 5-129, April 27-29, 1960.

scriptors: *Sprinkler irrigation, *Sewage treatnt, *Nutrients, Phosphorus, Nitrogen, Rates of plication, Costs, Eutrophication, Minnesota, rdness (Water), Water quality control.
ntifiers: *Nutrient removal, Algal growth, Lake dy, Alum coagulation, Lime coagulation, Ridge furrow method, Effluent ponding, Litigation, ound-water quality, Detroit Lakes, Minnesota.

e history of sewage treatment and disposal, by a ort town in an area of recreational lakes in Minota, is described. Investigation of methods of rient removal resulted from a lawsuit brought inst the city by property owners on a wnstream lake in which increasing algal blooms re becoming a nuisance. Minnesota Department Health made recommendations for a study pro- m of the problem. Consideration was given to experimental alum coagulation method, studied he University of Wisconsin, and lime coagula- n experiments at Detroit Lakes, by the Minota Department of Health. Ponding of effluent s also considered, but irrigation was the method lly selected. Site investigation was carried out determine soil permeability, effects of vegeta-, probability of odors, operating conditions in ter, and effects on ground water. Cost of initial tallation (1955) to handle 600 gpm was $6,500. ect on ground water was determined by before after samples from a test well which showed a " rise in water level in four years; total increases ppm: phosphorus, 0.6 to 2.9; nitrogen, 2.6 to 2; hardness, 300 to 420. Operating costs of the tallation are essentially that of power requirents. (Ketelle-Wisc)

Water from storage ponds, filtered through bottom mud and a body of sand, was measured for chloride, forms of nitrogen, oxygen, organic matter, algae, and bacterial content. To study benthos, water was analyzed from wells constructed at distances from a pond in the direction of flow. Not only dissolved organic matter, as determined by the potassium permanganate method, is mineralized, but much more oxidant (free oxygen plus nitrate oxygen) is used, apparently in the benthos. The high oxidant consumption indicates that the reduction of organic matter is intense. Organic substances, detectable by taste, are not completely eliminated. When there is a constant supply of new oxidant, dead biological materials may be mineralized aerobically. If this supply is terminated, anaerobic transformations may dominate. Probably bacteria are strongly adsorbed to the sand grains in concentrations resulting in intense struggle for life and decrease rapidly with increasing distance from the pond. Samples from the bottom of the ponds downward showed pronounced decrease in bacteria at 0.5-meter depth. A small amount of silt in the water may cause clogging of the soil. The intermittent infiltration system affords the same permeability of the sand each year with the consequent use of available purifying actors. (See also Vol. 2, No. 18, Field 5C, W69-07423). Identifiers: *Proteolysis, Streptomyces griseus, Sepedonium, Space, Aerobacter cloacae, Bacillus subtilis, Bacillus mesentericus, Bacillus cereus, Achromobacter delicatulum, Penicillium, Fusarium aquaeductum, Oospora, Phonia, Trichosporon cutaneum, Geotrichum, Nocardia actinomorpha, Paracolobactrum aerogenoides, Escherichia intermedia, Zooglea ramigera, Gelatin, Casein, Glucose, Lactose, Starch, Alcaligenes bookeri, Alcaligenes faecalis, Flavobacterium aquatile, Flavobacterium balustinum, Flavobacterium devorans, Feces, Clarifiers, Bacillus circulans, Bacterium linens, Bacillus endorhythmos, Leuconostoc mesenteroides, Bacillus amyloliquefaciens, Bacillus natto, Clostridium, Aspergillus.

Proteolytic microorganisms and their enzyme systems play important roles in sewage disposal systems and in the closed ecological system which contains a microbial population capable of generating a food supplement from wastes. The cultural characteristics of floc-forming bacteria from activated sludge, intermittent sand filters, and actively assimilating dairy waste sludge, are significant. Certain Bacillus and Bacterium species seem to be responsible for high purification rates and ability of the sludge to remove and store oxygen-demanding substances. No microbial enzymes have been clearly shown to be active only on proteins. All have been found to possess wide ranges of side-chain specificity. Usually, utilizable carbohydrates supply the energy for synthesis of protein and incorporation of amino acids into microbial protein. There is still doubt that microbial ribosomes alone are responsible for peptide bond formation and synthesis of soluble protein. Difficulties remain in relating in vitro incorporation of amino acids into ribosomes to the synthesis of protein in vivo. How deoxyribonucleic acid is involved in synthesis of bacterial enzymes is not yet completely clear. It is difficult to state that there is necessarily one correct series of reactions or one path of protein biosynthesis. (See also Vol. 2, No. 18, Field 5C, W69-07423). (Jones-Wisc)

Civil Eng, Vol 39, No 6, pp 38-42, June 1969. 5 p, 3 photo, 1 tab.

Descriptors: *Water reuse, *Sewage treatment, *Nevada, *California, *Lakes, Waste water disposal, Inter-basin transfers, Water pollution control, Water quality control, Tertiary treatment, Activated carbon, Filtration, Reclaimed water.
Identifiers: *Lake Tahoe.

The 7.5-mgd reclamation plant at the South Tahoe Public Utility District is the most advanced full-scale wastewater treatment plant in the world. Treatment consists of 2 basic parts, liquid processing and solids handling. The first 2 steps of liquid processing are the conventional ones of primary, or solids separation, and secondary, or biological oxidation. In addition, the advanced treatment provides chemical treatment and phosphorus removal, mixed-media filtration, activated carbon adsorption, and disinfection. The solids handling system provides for incineration of biological sludge, regeneration and reuse of granular activated carbon, and recalcining and reuse of lime, all by means of multiple hearth furnaces equipped with scrubbers and afterburners. Results to date indicate that the plant removes all of the suspended solids, color, odor and bacteria; most of the BOD, COD, MBAS, and phosphorus; and 50 to 98% of the nitrogen. Reclaimed water is exported from the Tahoe Basin and used to irrigate croplands. (Knapp-USGS)

NITROGEN LOSSES FROM ALKALINE WATER IMPOUNDMENTS,
San Diego State Coll., Calif. Dept. of Civil Engineering.
Frank E. Stratton.
ASCE Proc, J Sanit Eng Div, Vol 95, No SA2, Pap 6495, pp 223-231, Apr 1969. 9 p, 5 fig, 1 tab, 3 ref. Grant No GK-1623 NSF.

Descriptors: *Denitrification, *Ammonia, *Nitrogen cycle, *Eutrophication, Water treatment, Sewage treatment, Water pollution control, Waste water treatment, Lagoons, Biodegradation.
Identifiers: *Nitrogen removal.

Results of an investigation of gaseous ammonia nitrogen losses from alkaline water impoundments are presented. A method of field measurement of these losses is described and a comparison made between rates of loss predicted from a study of impounded water samples with rates of loss obtained by direct field measurement. Results indicate that warm eutrophic impoundments are potentially able to liberate significant quantities of gaseous ammonia nitrogen to the atmosphere due to natural degasification processes. (Knapp-USGS)

CONSERVATION OF WATER BY REUSE IN SOUTH AFRICA,
Council for Scientific and Industrial Research, Pretoria (South Africa).
G. J. Stander, and J. W. Funke.
Water Reuse Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 1-12, 1967. 12 p, 16 fig, 6 tab, 11 ref.

Descriptors: *Water reuse, *Reclaimed water, *Sewage treatment, Industrial wastes, Municipal wastes, Water utilization, Byproducts, Chemical wastes, Pulp wastes.
Identifiers: *South Africa, Breweries, Vaal River (S. Africa).

The present water potential for urban, industrial, and agricultural development in South Africa is only 900 gal/person/day, as compared with the 3,700 gal/person/day in the USA. The reuse of water in South Africa, especially in highly industrialized areas such as the Vaal Triangle which produces about 50% of the country's manufacturing output, is becoming a major issue. Although reuse of water in South Africa can, and probably will, be vastly increased, significant instances of such practice already exist. The following cases are briefly discussed; reclamation of sewage effluent for domestic recycling at Windhoek, South West Africa, based on successful pilot-scale investigations; use of biologically oxidized sewage effluent as cooling water in power generation; use of purified sewage effluent in pulp and paper manufacture; and the conservation of water by reuse within factories. Examples cited in the latter category include a beer brewery; an organic chemical industry in which the replanning of water management has, apart from a considerable saving in water consumption, resulted in the recovery of salable by-products; and a major iron and steel industry where stringent water economy is practiced. Emphasis is placed on the key role of research in water resources exploitation. (Knapp-USGS)

CONSERVATION OF WATER BY REUSE IN THE UNITED KINGDOM,
Water Research Association, Medmenham (England); and Water Resource Board, Reading (England).
Derek G. Miller, and David H. Newsome.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 13-31, 1967. 19 p, 9 fig, 3 tab, 30 ref.

Descriptors: *Water reuse, *Reclaimed water, *Sewage treatment, Industrial wastes, Municipal wastes, Water utilization, Water temperature, Water loss, Water pollution, Costs, Water conservation.
Identifiers: *United Kingdom.

The historical background of water supply in the United Kingdom and the influence of recent legislation on water resources planning and effluent control are outlined. General consideration is given to available resources and the development of the pattern of demand. The principles of recycling are considered in relation to the overall effects and the impact on individual users. In particular the questions of effluent quality and disposal are discussed in the light of past practices. Some of the commonly used treatment methods are described and are shown to consist mainly of techniques to remove suspended solids and certain organic materials. Examples are given of recycling applications in the United Kingdom which have mainly arisen due to the shortage of water in certain areas. Finally, the paper attempts to assess the likely trends and possible limitations in the future use of recycling techniques. (Knapp-USGS)

CONSERVATION OF WATER BY REUSE IN ITALY,
Azienda Acquedotto Municipale di Torina (Italy).
Fulvio Meucci.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 32-36, 1967. 5 p, 5 fig, 1 tab, 11 ref.

Descriptors: *Water reuse, *Reclaimed water, Sewage treatment, Industrial wastes, Municipal wastes, Water utilization, Water temperature, Water pollution, Water conservation, Groundwater, Aquifers, Irrigation water, Water supply, Water resources development, Costs.
Identifiers: *Italy.

Water reuse in Italy is affected by underground availability and water rates. Three Italian reuse plants are described: In a sugar factory after simple sedimentation and sterilization, washing and conveying waters are recirculated; in a metal-working factory, acidic and alkaline waters are singly treated for removing cyanide and chromium and then mixed, neutralized, and clarified to be reused in a rain irrigation system and in fire protection; in a steel pipe mill, acid-washing waters and cooling waters, containing iron slags, are recirculated after oil removal, addition of hydrated lime, and clarification by ferrous sulfate, and cooling. CONSERVATION OF WATER BY REUSE IN MEXICO,
Celulosa y Derivados, S.A., Monterrey (Mexico).
Carlos Griffith.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser 78, Vol 63, pp 37-40, 1967. 4 p, 8 tab.

Descriptors: *Water reuse, *Reclaimed water, *Sewage treatment, Water quality, Industrial wastes, Municipal wastes, Water utilization, Water conservation, Irrigation water, Water supply.
Identifiers: *Mexico.

Water is reclaimed for reuse in Mexico in 16 plants by the activated sludge process. Total capacity is 85.5 mgd. Most of the water is used for cooling, fire protection, and irrigation. Chemical analyses of water from each stage of treatment are tabulated. (Knapp-USGS)
W69-08034

WATER REUSE IN WEST GERMAN INDUSTRY,
Ruhrverband, Essen (West Germany).
Norbert Wolters.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 41-45, 1967. 5 p, 5 fig, 8 ref.

Descriptors: *Water reuse, *Reclaimed water, Industrial wastes, Municipal wastes, Water utilization, Costs, Taxes, Sewage treatment, Water resources development, Water pollution treatment.
Identifiers: *Germany, Ruhr Valley, Rhine Valley, Sewage taxes, Pollution taxes.

The great concentration of water-using industries in the Ruhr Valley, and the need to minimize pollution of the River Rhine, have forced maximum intraplant reuse of water. Special efforts are made in new plant design to make more effective reuse possible, resulting in the case of one steel mill completely reusing all incoming water. The creation of area water management associations that charge individual plants on the basis of pollution load of their effluents makes it worthwhile to continue studies for more efficient reuse. Special problems associated with beet sugar, coal mining, electroplating, and heavy chemicals industries are discussed.
W69-08035

THE UTILIZATION OF MUNICIPAL WASTEWATER IN JAPAN,
Ebara-Infilco Co., Tokyo (Japan).
Tetsuo Ide, Nobuo Matsumoto, and Hidenobu Arimitsu.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser 78, Vol 63, pp 46-53, 1967. 8 p, 14 fig, 3 tab, 16 ref.

Descriptors: *Water reuse, *Municipal wastes, *dustrial water, *Reclaimed water, Cooling wa Hardness (Water), Dissolved solids, Water qua Sewage treatment, Water sources, Costs, Turbic
Identifiers: *Japan, Tokyo.

The rapid progress of Japanese industry resulted in an increasing demand for water. C sequently, greater emphasis is beginning to placed on water conservation. As a poter method for water conservation, some of the ci in Japan have built large industrial water pl utilizing sewage plant effluent as the water sou and have supplied a colloidal matter-free effl to industries in the area. Suspended or collo matter is removed by coagulation with alumir sulfate or ferric chloride, followed by sedime tion and filtration. Retardation on chemical soft ing caused by phosphate in sewage plant effl can be overcome by the use of ferric chloride coagulant. (Knapp-USGS)

CONSIDERATIONS ON THE REUSE WATER IN CERTAIN INDUSTRIES,
Centre Belge d'Etude et de Documentation Eaux (Liege).
E. H. T.H. Le Clerc.
Water Reuse, Amer Inst Chem Eng Progr Sy Ser No 78, Vol 63, pp 66-73, 1967. 8 p, 19 ref.

Descriptors: *Water reuse, *Sewage treatme *Reclaimed water, *Recirculated water, Indust wastes, Industrial water, Cooling water, Wa utilization, Pulp and paper industry, Steel, Su beets, Coal mines.
Identifiers: Industrial water recirculation.

Water reuse in the coal mining, sugar, steel, paper industries is discussed. In the steel indus once-through use of 80-200 cu m of water per of steel may be reduced by recirculation to 2.5-4 m per ton. Treatment consists of cooling removal of iron, cyanides, sulfur compounds, ides, and suspended solids. Coal mines use 100-4 cu m of waste water per ton of coal. Suspend solids and phenols must be removed both for re and before final disposal. Sugar refineries can re most of their processing water, which is a seri source of pollution when it is discharged untreat Processing of sugar requires 13-28 cu m per t Mud and organic materials must be removed reuse and before discharge. Paper making u about 100 cu m of water per ton of paper. The p cipal waste constituents to be removed suspended inorganic and organic solids and solved organic matter. (Knapp-USGS)

ry C. Bramer, and Richard D. Hoak.
er Reuse, Amer Inst Chem Eng Progr Symp, No 78, Vol 63, pp 92-95, 1967. 4 p, 7 ref.

criptors: *Water reuse, *Reclaimed water, ter management (Applied), Recreation, Irriga- Multiple-purpose projects, Artificial recharge, strial water, Sewage treatment, Cooling, Recir- ted water.
tifiers: Water reclamation, FWPCA.

ent-day water reclamation in the United States ists principally of the use of treated municipal ewaters for recreation lakes, irrigation, ndwater recharge, and industrial purposes. treatment usually consists of primary settling, ndary treatment by activated sludge or in oxon ponds, and effluent chlorination. Although e are many instances of water reclamation g practiced in the United States today, the nitude of the water use involved is small. Ir as reclamation is a solution to problems of ly, the greatest potentials are in the arid ern states, where an expanding economy and a ward moving population will increasingly press n already limited supplies. Reclamation also, ever, presents an attractive alternative to simstream disposal of treated effluents, in many s from an economic standpoint even with uate freshwater supplies. Of particular sigance in the future is the increased economic ortance which recreational uses of the surface ers will have. (Knapp-USGS)

E MEDICAL PROFESSION'S ATTITUDE WARD WATER REUSE,
erican Medical Association, Chicago, Ill.
es G. Telfer.
er Reuse, Amer Inst Chem Eng Progr Symp, No 78, Vol 63, pp 101-105, 1967. 5 p, 20 ref.

criptors: *Water Reuse, *Psychological cts, Aesthetics, Attitudes, Decision making, ironmental engineering, Sewage treatment, irculated water, Municipal water.
tifiers: Medical profession attitudes.

sicians, a heterogeneous group, are vitally conied with life and environment, and especially water and its uses. They think of many cycles of water, in the body and in the environment. There are many kinds or reuse--of many kinds of water. Direct reuse in community drinking systems is a part of total environmental management. Medical societies are a good means of determining the medical profession's attitude and ought to be included in all phases of such reuse programs. The physician's attitude to reuse of treated sewage effluent is likely to be favorable when need is demonstrated. Medical societies should be consulted for help and criticism in any public water reclamation projects if the water is to be used for human consumption. (Knapp-USGS)
W69-08042

THE ROLE OF CHEMICALS IN WATER REUSE,
Aquacontrol, Inc., Houston, Tex.
M. C. Forbes, and P. A. Witt, Jr.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 124-129, 1967. 6 p, 5 fig, 4 ref.

Descriptors: *Water reuse, *Sewage treatment, *Reclaimed water, *Recirculated water, *Water chemistry, Municipal wastes, Industrial wastes, Tertiary treatment, Water purification, Potable water, Pollution control, Costs, Water costs, Water quality control.
Identifiers: Waste treatment chemicals.

Pollution is expanding exponentially and grows as the second power of population. These 2 facts make the adoption of the zero effluent plant an absolute necessity sooner than we had expected. Purification processes are pollutional processes. The entropy analogy of pollution processes indicates that the role of chemicals will become a continuously declining one. The shift in economics will, on the other hand, dictate that chemical engineers a managers and technologists will become more and more involved in waste prevention. The success of the individuals, and the plants with which they are associated, will be closely related to their skills in this area. Regulation will change sharply, and will be supported by public demand based on the all too obvious effects of increasing population density. These facts will be a tremendous threat and source of loss to some, and a real opportunity for competitive advantage for those who can sense these changes and adapt in time. (Knapp-USGS)
W69-08045

VIRUS REMOVAL IN WATER REUSE TREATING PROCESSES,
Maine Univ., Orono.
Otis J. Sproul, Leo R. Larochelle, David R. Wentworth, and Robert T. Thorup.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 130-136, 1967. 7 p, 2 fig, 6 tab, 24 ref.

Descriptors: *Water reuse, *Viruses, *Water purification, Filtration, Adsorption, Activated carbon, Biological treatment, Disinfection, Public health, Water treatment.
Identifiers: Virus removal.

The literature is reviewed for virus removal by primary and secondary treatment processes. The activated sludge process has been reported to yield removals of viruses in excess of 90%. Chlorination, as presently practiced, results in removals of only 90 to 99%. The adsorption of T2 bacteriophage on activated carbon from a secondary effluent was reversible and never exceeded 35% at low flow rates. Removals of Type 1 polio virus in excess of 90% were obtained in the lime precipitation of phosphate. (Knapp-USGS)
W69-08046

IONIZING RADIATION IN WATER REUSE,
Unidynamics/Phoenix, Ariz.
Hal R. Spragg, and Richard L. Curtin.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 137-142, 1967. 6 p, 3 fig, 19 ref.

Descriptors: *Water reuse, *Water treatment, *Water purification, Ionization, *Radioactivity techniques, Oxidation, Sewage treatment, Chemical degradation, Tertiary treatment, Organic matter.
Identifiers: Ionizing radiation, Radiolysis, Gamma radiation.

The use of gamma radiation as a unit process has become firmly established in the past decade and is of significant potential value in amerliorating some of the present problems associated with the treatment of wastewater for reuse. Recent studies of the effects of radiation on domestic sewage showed that the sedimentation of suspended solids is significantly accelerated and that the radiolysis of dilute, aqueous systems of various contaminants results in products which are either less refractive to removal by conventional means or not objectionable as constituents of effluent water. The radio-oxidation of ammonia is analyzed as a model system. The costs of radiation have moderated significantly over the past few years. The principal expenditures required are for the treatment facility itself and for the radioactive material. Expenses for personnel training and facility maintenance are moderate to nominal. (Knapp-USGS)
W69-08047

PHOSPHATE REMOVAL BY ACTIVATED SLUDGE AT SAN ANTONIO, TEXAS,
Municipal Waste Water Treatment Plants, San Antonio, Tex.; and Texas Univ., Galveston. Medical Branch.
Don Vacker, C. H. Connell, and W. N. Wells.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 148-158, 1967. 11 p, 9 fig, 11 tab, 13 ref.

Descriptors: *Sewage treatment, *Phosphates, *Activated sludge, *Adsorption, *Texas, Biodegradation, Biochemical oxygen demand.
Identifiers: Phosphate removal.

Phosphates are removed in municipal wastewater treatment plants in the aeration tanks by sorption to the activated sludge solids under proper operational conditions. Removal is necessary to prevent algae growths in streams receiving plant effluent. Dissolved oxygen, biochemical oxygen demand to activated sludge loading, mixed liquor suspended solids, ammonia, nitrate, and sludge volume index was studied. Effects of dissolved oxygen, desorption, variation in daily load, and phosphate in waste activated sludge were also studied. Effect of operational differences of three parallel plants are noted. Nonreturn of waste activated sludge degradation products is essential unless chemically treated. Future design and operation considerations are proposed. (Knapp-USGS)
W69-08048

PROBLEMS AND PRACTICE OF PHOSPHATE REMOVAL IN WATER REUSE,
Lawrence K. Cecil.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 159-163, 1967. 5 p, 22 ref.

Descriptors: *Water reuse, *Sewage treatment, *Phosphates, Activated sludge, Adsorption, Biodegradation, Chemical precipitation, Waste water disposal.
Identifiers: *Phosphate removal.

The literature on phosphate removal for waste water reuse is reviewed. The operation of full-scale plants is compared with theory. Pilot plant studies show that phosphate can be removed effectively by adsorption on sludge, and that sludge may be treated to recover process reagents. (Knapp-USGS)
W69-08049

WATER RECLAMATION WITH GRANULAR ACTIVATED CARBON,
Pittsburgh Activated Carbon Co., Pa.; and Calgon Corp., Pittsburgh.
J. C. Cooper, and D. G. Hager.

LIBRARY U. OF L. URBANA-CHAMPAIGN

Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 185-192, 1967. 8 p, 5 fig, 8 tab, 10 ref.

Descriptors: *Water reuse, *Water costs, *Desalination, *Sewage treatment, Costs, Optimization, Decision making, Cost-benefit analysis, Activated carbon, Tertiary treatment.
Identifiers: Desalination costs, Water reclamation costs.

The costs and efficiency of water reclamation by activated carbon are summarized and processing design parameters are tabulated for optimizing engineering decisions in reuse. The present state of activated carbon system development suggests that the process is immediately applicable to many municipal and industrial wastes for pollution abatement or for water reclamation. Municipal waste water reclamation could produce potable water at 16 cents per 1,000 gal at an investment of $33 million. This may be compared to the recent proposal to build a sea-water desalination plant in Southern California to supply 150 mgd at 23-30 cents per 1,000 gal at an investment of $300 million. (Knapp-USGS)
W69-08050

SUCCESSES AND FAILURES IN WATER REUSE,
Cosden Oil and Chemical Co., Big Spring, Tex.
Warden W. Mayes, and William E. Gibson.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 197-200, 1967. 4 p, 2 fig, 1 tab, 3 ref.

Descriptors: *Water reuse, *Municipal wastes, *Reclaimed water, *Decision making, Oil industry, Cooling water, Costs, Water costs, Water quality, Water treatment, Sewage treatment.
Identifiers: Water reuse costs.

An oil refinery's experience with using reclaimed municipal waste water for 15 years is discussed and economic data are presented to aid in making decisions in the choice between using sewage effluents and other sources of poor-quality water. Foaming, corrosion, and excessive gypsum content of the water were the only major problems encountered. (Knapp-USGS)
W69-08051

HISTORY AND POSSIBLE FUTURE OF MULTIPLE REUSE OF SEWAGE EFFLUENT AT THE ODESSA, TEXAS INDUSTRIAL COMPLEX.
Aetron, Covina, Calif.; and El Paso Products Co., Odessa, Tex.
F. W. Kirkpatrick, Jr., and E. F. Smythe.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 201, 209, 1967. 9 p, 3 fig, 1 tab, 2 ref.

Descriptors: *Water reuse, *Reclaimed water, Municipal wastes, *Recirculated water, *Oil industry, *Texas, Sewage treatment, Desalination, Water sources, Water management (Applied), Industrial water, Cooling water, Ion exchange, Water storage.
Identifiers: Odessa (Tex).

Present treatment to produce makeup to boilers and cooling towers from sewage effluent is shown by schematic flow diagram, and performance is indicated by water analyses. Operating experience with problems relating to sewage effluent storage, ion exchange resin beds, and calcium carbonate precipitation after lime treatment are discussed. Wastewater treatment and disposal by further use in oil field water flood operations is described. Examples of present reuse and some further potential reuses developed during a study by Aetron are presented. A possible future sewage treatment system and a system to maximize reuse by using a desalting process as suggested by the Aetron study are described. (Knapp-USGS)
W69-08052

REMOVAL OF NITROGENOUS COMPOUNDS FROM WASTEWATERS,
Carnegie-Mellon Univ., Pittsburgh, Pa.
William R. Samples.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 223-229, 1967. 7 p, 1 fig, 35 ref.

Descriptors: *Waste water treatment, *Water reuse, *Nitrogen, Nitrogen compounds, Oxidation, Biodegradation, Nitrification, Denitrification, Nutrients, Tertiary treatment, Algae, Ammonia.
Identifiers: Nitrogen removal.

Normal treatment of our waterborne wastes has not in the past been concerned with removal of nitrogenous materials. In recent years, however, waste discharges containing compounds of nitrogen have been incriminated in the fertilization of streams and lakes, causing possible health hazards, and in general, causing a decrease in water quality for many uses. A review of many investigations into mechanisms for removal of nitrogenous materials in waste effluents is given. The mechanisms reviewed include both biological and chemical methods. Nitrogenous materials may be removed from waste effluents by any one of several methods. The most applicable at the present time appear to be denitrification, incorporation by algae, and ammonia stripping. The selection of the proper method for nitrogen removal in any particular case will depend on the local circumstances, including other treatments required, degree of nitrogen removal desired, chemical quality of the water, further uses for the water, and many others. The removal of nitrogen from effluents will be expensive but will by justifiable in an increasing number of instances. (Knapp-USGS)
W69-08053

A DESIGN PROCEDURE FOR BIOLOGICAL NITRIFICATION AND DENITRIFICATION,
Texas Univ., Austin.
W. Wesley Eckenfelder, Jr.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 230-234, 1967. 5 p, 6 fig, 1 tab, 6 ref, append.

Descriptors: *Denitrification, *Biodegradation, *Water reuse, *Reclaimed water, Nitrogen compounds, Nitrogen, Ammonia, Nutrients, Biochemical oxygen demand, Tertiary treatment, Algae, Bacteria, Activated sludge.
Identifiers: Nitrogen removal.

The removal of nitrogen from sewage and industrial wastewaters is assuming increasing importance as the waste loadings from urban and industrialized areas increase. Unoxidized nitrogen exerts on oxygen demand on the receiving waters and oxidized nitrogen serves as a nutrient source for algal growth. It is possible to remove nitrogen by biological means by first oxidizing ammonia to nitrates followed by denitrification in which microorganisms reduce the nitrate to nitrogen gas. Studies which have been conducted on this process to date in laboratory, pilot-plant, and, to a limited extent, plant-scale investigations are reviewed. The theory of the process operation is developed from basic microbiological considerations. A design example for a sewage treatment plant is presented to illustrate the development of the process. CURRENCE AND SIGNIFICANCE OF TICIDE RESIDUES IN WATER,
eral Water Pollution Control Administration, ens, Ga. Southeast Water Lab.
age Nicholson.
ash Acad Sci, Vol 59, No 4-5, pp 77-85, Apr- 1969. 9 p, 1 tab, 29 ref.

criptors: *Water pollution sources, *Water pol- n effects, *Pesticide residues, Fishkill, Pesti- kinetics, Water pollution control, Runoff, T, Dieldrin, Endrin, Chlorinated hydrocarbon icides, Organophosphorus pesticides.
tifiers: Pesticide pollution.

er pollution by insecticides has been a problem e the 1940's. Many of the synthetic pesticides very lethal to aquatic life, and fishkills and loss ie aquatic insects eaten by fish are common oc- ences. Sublethal concentrations of insecticides e high residual concentrations in fish; when the are eaten by birds, damage to the birds is a uent result. An agricultural watershed with 00 to 16,000 acres of cotton treated with 00 to 14,000 lbs of toxaphene, DDT, and BHC sampled. Insecticide concentrations were erally less than 1 microgram per liter in the r water, and insecticides were detected all year, just during the application season. DDT was om recovered from water because it was lly associated with stream sediment. Pesticide e discharges, accidents, and carelessness often taminate surface waters. Pesticide pollution trol depends on prevention of spills into waters upon user control of agricultural application to ent contamination of runoff. The use of the ly degrading chlorinated hydrocarbons should restricted and carefully regulated. (Knapp-GS).

Identifiers: Chesapeake Bay (Md).

The problems of the Chesapeake Bay shoreline and of the waters of the bay are discussed. The physical problems discussed are erosion, sedimentation, flooding, eutrophication, polluted shellfish areas, thermal pollution, plant and animal nuisances, and the use of and damage to wetlands. Stream water quality is discussed with reference to Maryland's water quality standards. Agencies involved in water resources, hunting, fishing, and recreation are listed and their areas of responsibility are discussed. (Knapp-USGS)

United Kingdom Atomic Energy Authority, Wantage (England). Research Group.
P. A. Cawse.
J Sci Food Agric, Vol 19, pp 395-398, July 1968. 3 fig, 1 tab, 17 ref.

Descriptors: *Irradiation, *Gamma rays, *Nitrogen, *Soils, Sediments, Nitrogen compounds, Nitrification, Nitrogen cycle, Bacteria, Soil bacteria, Organic soils, Cycling nutrients, Radioecology.
Identifiers: Ammonium ions, Mineral nitrogen, Nitrifying bacteria.

Gamma-irradiated soils that had received 0.05 to 3 Mrad showed a significant increase in extractable nitrate-nitrogen. The response was greatest for the most organic soil. Perfusion of the soil with ammonium ions showed that rapid nitrification occurred after doses greater than 0.1 Mrad. This increase resulted from oxidation by non-proliferating cells of the nitrifying bacteria rather than from increased proliferation of the survivors. (Konrad-Wisc)

A SYSTEMS ENGINEERING APPROACH TO WATER QUALITY MANAGEMENT,
Kaiser Engineers, Oakland, Calif.
E. J. Stann, and R. J. Ringwood.
Civil Eng, Vol 39, No 6, pp 74-79, June 1969. 6 p, 4 fig.

Descriptors: *Planning, *Water pollution control, *Water resources development, *California, *Systems analysis, Estuaries, Model studies, Mathematical models, Optimization, Water management (Applied), Regional analysis, Water reuse, Tertiary treatment.
Identifiers: *San Francisco Bay area, Systems engineering.

The San Francisco Bay area has enough water, but much will be exported, thus reducing its waste-dilution capacity. An increasing amount of agricultural drainage is worsening the problem. A proposed region-wide solution, includes quality and effectiveness, cost feasibility, geo-economic influences, and social and esthetic requirements. Two new parameters of waste disposal and waste effects--toxicity and biostimulation--were employed. Three mathematical models of the area and system were used: a tidal hydrodynamic model, a dynamic water quality model, and a dispersion water quality model. Treatment and disposal facilities, should be constructed in 3 phases: Phase 1, 1970-1980, to convey effluents from problem areas where there is little waste dilution, toward the central Bay. Phase 2, 1980-1990, features a major ocean outfall and diffuser system, with wastes sent to the ocean getting advanced primary treatment, Phase 3, 1990-2020, essentially a planning guide, calls for regional reclamation of municipal wastewaters. The regional system is preferred over the present local-treat ment arrangement. The regional system is somewhat less costly. The study showed that the system engineering approach is essential in preparing a regional water management plan. (Knapp-USGS)

Descriptors: *Oily water, *Water pollution sources, *Ships, *Oil wastes, *Water pollution treatment, Water pollution control, Disasters, Industrial wastes, Shores, Aquatic life.
Identifiers: *Oil spill prevention and cleanup.

A review was made to evaluate the current state of technology of prevention and control of major oil spillage on water, the restoration of the shore face and waterfowl, and the effects of oil pollution and defensive measures on aquatic life. The study was made to assist in establishing procedures and facilities for standardized control and cleanup based on current technology and experience, and to show that additional research and development could result in improved capability for prevention, control, and restoration. Detailed research and development recommendations for prevention, control, and restoration are made. A plan of action which improves the capability for preventing and combating oil spillage and for minimizing its consequences is proposed. (Knapp-USGS)

WATER RESOURCES AND THE LEGISLATIVE BRANCH,
Subcommittee on Air and Water Pollution (U. S. Congress).
Donald E. Nicoll.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 88-91, 1967. 4 p.

Descriptors: *Water pollution control, *Water Quality Act, *Legislation, Water quality control, Waste treatment, Governments, Research and development, River basin development, Planning, Water resources development, Water law.
Identifiers: *Water Pollution Control Act, FWPCA.

Environmental contamination threatens to reduce available water supplies below demands. The Water Quality Act of 1965 upgraded the water pollution control program administration and established a water quality standards system for water resource planning, management, and improvement. The 1966 Water Pollution Control Act amendments increased Federal sewage treatment construction grants and increased grants for research and development of improved methods for industrial and municipal waste treatment. Next steps involve river basin planning and development, simplification of Federal grant programs, new control techniques, and better understanding of long-term pollution threats. (Knapp-USGS)

LEGAL ASPECTS OF WATER REUSE IN TEXAS,
Vinson, Elkins, Weems and Searls, Houston, Tex.
Victor W. Bouldin.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 110-113, 1967. 4 p.

Descriptors: *Water law, *Texas, *Water reuse, Reclaimed water, Recirculated water, Legal aspects, Prior appropriation, Water transfer, Water management (Applied), Water rights, Water policy, Sewage treatment.
Identifiers: Texas Water Law.

The basic water laws in Texas are discussed, as well as the possibilities and liabilities in transfer of ownership of wastewater for subsequent reuse. Texas uses the system of prior appropriation rights to water. Depending on the water permit, water may be reused by the appropriator or may be sold for others' reuse. Each permit specifies the use the appropriator may make of the water and what portion of it must be returned. Limitations of rights include source, purpose, amount, point of diversion, point of return, description of land irrigated, and interbasin transfers. Contracts for reuse should specify rights, duties, obligations, and liabilities of all parties, the amount of water to be delivered, rates of delivery, periods of delivery, temperature, method of delivery, pressure, price, and disposition after reuse. ECONOMY OF WATER QUALITY MANAG MENT AND POLLUTION CONTROL,
Federal Water Pollution Control Administrati Washington, D. C.
James J. Plannery.
The Fresh Water of New York State: Its Conser tion and Use, pp 51-57, Wm C Brown Book C Dubuque, Iowa, 1967. 7 p. Edited by Lauren Hitchcock.

Descriptors: *Water quality, *Energy, *Conser tion, *Water pollution control, *Waste dispos Fishing recreation, Water treatment, Cos Benefits.
Identifiers: *Water quality management, Pub water, Least-cost alternatives.

This paper describes the dimensions of the wa pollution problem; indicating the sources, t kinds, the effects, and the magnitudes of pollutio so far as they are known. The economic aspects pollution are based on the conflicts between wa disposal and other uses of the public waters. T greatest conflict is with the uses that take place the public waters themselves -- fishing, recreatio and aesthetics. The withdrawal uses are also fected but those effects may be corrected by wa treatment. An optimum arrangement among us including waste disposal, can be determined analyzing incremental costs and benefits or by c culating the benefit and cost variations among d ferent least-cost alternatives. Furthermore, t

er says that requiring waste disposers to pay in portion to their use of the public waters for osal probably would facilitate the optimization cess considerably, for it would cause the waste osers to be cost-conscious to the extent that would reduce wastes to save money. Intensive y of the idea is urged. (See W69-08076). eb-Rutgers)

ME DATA ON DIFFUSION AND TURBU-NCE IN RELATION TO REAERATION,
ois Univ., Urbana. Water Resources Center.
. Holley.
earch Report No 21, Water Resources Center, versity of Illinois July, 1969, iii+ 53 pp, 13 fig, ef. OWRR Project A-021-ILL.

criptors: *Reaeration, *Dissolved oxygen, Dif-on, Turbulence.

t was used as a tracer to determine diffusion s immediately below the free surface both in 'film' region and in the remainder of the water mixing vessel. The results tend to indicate that iffusion model can be used to represent the nward transport of a substance which is being orbed at the free surface. Apparently, the diffu-coefficient in the 'film' can be either equal to greater than the molecular coefficient depend-on the amount of mixing at the free surface. Hot anemometry was used to determine turbulence racteristics from 1 in. to 0.006 in. below the surface of a laboratory open channel flow. The rgy spectra indicate no significant changes in the turbulence in this region. Thus, apparently turbulence exists to the free surface and in the 'film' region.

THE CHANGING VIEWPOINTS OF WATER RESOURCES PLANNING,
Board of Engineers for Rivers and Harbors, Washington, D. C.
Vernon L. Kimball.
Prepr 772, Amer Soc Civ Eng Annu Meet Nat Meet Water Resour Eng, New Orleans, La, Feb 1969. 27 p, 9 ref, append.

Descriptors: *Water resources, Project planning, Planning, *Attitudes, Social aspects, Decision making, Federal Government, State Governments, Local governments, Economics, Economic feasibility, Forecasting, Social values, Benefits.
Identifiers: *Regional planning, Regional authorities, Federal-State Cooperation, Appalachian Redevelop Act 1965.

Water resources planning is becoming more and more an intergovernmental effort including Federal, state, and local governments. Coordinating water resources planning with urban planning is becoming increasingly necessary. The regional type of planning authority will become more prevalent; the planner will be required to deal with factors other than water resources. This type of planning authority should build greater political acceptability into comprehensive water resource development plans. To meet the needs of future growth and improve the present environment, full use of our resources will be required. An increasing trend toward decentralization of water resources planning is evident. The past centralizing tendency at the Federal level is being reversed gradually by delegating authority to lower levels through greater use of Federal grants and other aid devices and through river basin commissions and regional authorities. The Federal planner will retain his responsible senior role under most of these new concepts. The best prescription for the planner is to recommend initial plans based on sound facts and professional judgment. Subsequently, he must follow closely a feedback process and revise his plans accordingly. (USBR)
W69-07783

SHOULD THE ENGINEER HAVE THE LEADING ROLE IN WATER RESOURCES PLANNING,
Minnesota Univ., Minneapolis.
Edward Silberman.
Prepr 803, Amer Soc Civ Eng Annu Meet Nat Meet Water Resour Eng, New Orleans, La, Feb 1969. 12 p, 9 ref.

Descriptors: Engineering, *Engineering personnel, *Leadership, *Water resources, Decision making, *Planning, Projects, Benefits, Professional personnel, Consulting engineers, Natural resources, Public opinion, Water resources development.
Identifiers: Cooperation.

The engineer must work as part of a water resources planning team with members of other disciplines (biologists, ecologists, and conservationists), as well as sportsmen in the planning process. As to who should lead the team, the answer does not lie in stating categorically that the engineer or any other specialist should be the leader. The leader is the man who can weld together successfully the many interests bearing on the problem under study. He must recognize what

IOWA U. OF L. URBAN-CHAMPAIGN

the various interests are, and select effective representatives for each. The engineer should be a primary candidate because technical engineering problems are still the major problems in water resources development. The public recognizes that the engineer has a long history and much experience in leading such projects. The well-trained engineer is better qualified than practioners of most other disciplines to advise the planning group and public that every improvement has its cost and to state the relationship between the benefits and costs, even if they cannot be measured entirely in money. Although the leader frequently must play the role of mediator, he must not be a passive mediator if timely solutions for water resources problems are to be achieved. (USBR)
W69-07786

REAL COSTS AND REAL BENEFITS UNDER PRESENT FEDERAL WATER RESOURCES EVALUATION PROCEDURES,
Manitoba Univ., Winnipeg.
Gunter Schramm.
Pap, Eighth Annu Meet, Western Reg Sci Ass, Los Angeles, Calif, Feb 1969. 23 p, 2 fig, 3 tab, 18 ref, append.

Descriptors: *Real costs, *Real benefits, *Evaluation, Project planning, Economics, Benefit-cost ratios, Benefits, Prices, Projects, Hydroelectric power, Hydroelectric plants, Thermal powerplants, Alaska, *Economic feasibility, Capital costs, Inflation (Economic), Economic prediction, Water resources, Bibliographies, *Federal Project Policy.
Identifiers: Benefit-cost analysis, Rampart Dam (Alaska), Cost indexes, Yukon-Taiya Proj (Alaska).

The practice of using current rather than expected future price relationships in evaluating potential Alaskan hydropower developments is examined. The prevailing practice of evaluating benefits and costs in terms of present costs and prices may not only lead to an understatement of actual costs, but also may lead to gross inefficiencies in project selection. This danger is particularly great in cases of hydro projects with long-term project sequences depending on some common facility for their feasibility. While the need to estimate future price relationships may introduce new uncertainties into project evaluations, the use of prevailing prices is even less satisfactory. A somewhat inaccurate estimate of future changes backed up by a sensitivity analysis testing the effects of the assumptions on overall benefits and costs will provide a more realistic picture. This issue is important since the traditional cost advantage of hydro over thermal alternatives is disappearing. With dramatic cost reductions expected from future atomic powerplants, power system planners must take these expected changes explicitly into account. (USBR)

THE ECONOMICS OF AN UPPER YUKON BASIN POWER DEVELOPMENT SCHEME,
Manitoba Univ., Winnipeg.
Gunter Schramm.
Ann Reg Sci, Vol 2, No 2, pp 214-228, Dec 1968. 15 p, 3 fig, 3 tab, 22 ref.

Descriptors: Project planning, *Project feasibility, Economics, Electric power, Electric power production, Feasibility studies, Electric power costs, Electric power demand, *Hydroelectric power, Capital costs, Water resources development, Diversion tunnels, Alaska, Hydroelectric plants.
Identifiers: *International cooperation, *Yukon River, Alaska, Canada, *International projects, British Columbia, Canada, Taiya Valley (Alaska).

Since 1947, several investigations aimed at harnessing the power potential of the Upper Yukon by diverting headwaters through the coastal mountains have been conducted. Such diversion schemes appear attractive because the headwaters form a series of lakes at elevations of 2000 ft, less than 20 air miles from low-lying coastal river valleys. Three development proposals would divert water to the Taiya Valley in Alaska, and one proposal would divert water to the Taku River in British Columbia. Cooperation of the U S and Canada in developing the Yukon-Taiya Project could lead not only to a least-cost solution in engineering terms, but also to a least-cost solution in economic terms. Full advantage could be taken of the existing differential in labor and capital costs. Without cooperation, developing the project does not appear feasible; with cooperation, both countries could possibly obtain a source of energy priced low enough to be competitive. Availability of very low-priced at-site power would be conducive to economic development in southeastern Alaska and in the adjacent, mineral-rich areas of the Yukon and British Columbia. (USBR)

INSTITUTIONAL CONSTRAINTS ON THE DEVELOPMENT OF A REGIONAL WATER SUPPLY SYSTEM: THE CASE OF DETROIT,
Norman Wengert, and George M. Walker, Jr.
Fourth American Water Resources Conference, American Water Resources Association, New York City, November 1968. 19 pp.

Descriptors: *Institutional constraints, *Water supply, Regional analysis, Administrative agencies, Economies of scale, Decision-making.
Identifiers: *Detroit (Mich), *Regional system.

Detroit has had a regional water supply system since 1969. Its purpose was to enact a program which would realize economies of scale for the region resulting from a large integrated water supply system, which would include areas outside the corporate limits. Significant institutional constraints developed which effected the pattern of regional development. The three functions of the water utilities accounting are shared by the Detroit Metropolitan Water System and local governments. Production and transmission are handled by Detroit Metropolitan Water System while distribution is handled by local governments. Two limiting factors have effected the efficiency of this separation of function: (1) The definition of distribution service areas is arbitrary, hence removed from a consideration of regional efficiency factors with equal discrepancies in organizational administrative arrangements, and (2) there is dispersal of control over rates paid by the ultimate consumers. Separation of functions has brought intergovernmental politics and administration to the fore in Detroit Metropolitan Water System and has made it vulnerable to a variety of pressures. In some cases regional efficiency and fairness is sacrificed in an attempt to deal with local governments. A case study of Flint is given as an example of the kinds of negotiations and issues involved in building the regional system. (Marriott-Chicago)

Identifiers: *Delaware River Basin.

The report discusses prospective needs for water and related resources in the Delaware River Basin through the year 2010. It identifies the areas of need and proposes construction or development of projects that will be required in the next six years for the optimum development and utilization of the Basin's water resources. Chapter I summarizes findings, draws conclusions, and recommends t the Commission complete specific projects and dies and continue to endorse early acquisition lands needed for future projects. Chapter II c siders the effects of location, quantity, quality, time on water supply. It analyzes undergro sources and surface streams, and considers the fects of importation and exportation on sup Chapter III discusses available water-rela resources, including natural and improved facil for recreation, electric power generation, navi tion, flood control, and water-quality cont Chapter IV discusses demands for w withdrawals, instream water demands, and mands for related products and services. Chapte establishes the need for water resources mana ment. It discusses increasing withdrawal dema flood control, power, recreation, fish, and wild water-quality control, and specific needs in e sub-basin. Chapter VI recommends projects programs for Commission endorsement, highlights the need for non-structural programs flood-loss reduction. (Gossen-Chicago)

WATER RESOURCE DEVELOPMENT CALIFORNIA: THE COMPARATIVE EF CIENCY OF LOCAL, STATE, AND FEDER AGENCIES,
Resources for the Future, Inc., Washington, D. C
Joe S. Bain.
For main entry see Vol 1, No. 12, Field 6B, W 05115. In Water Research, Johns Hopkins Pr Baltimore, 1966, pp 51-67. 5 tab, 2 ref.

Descriptors: *Economic efficiency, *Inter-age cooperation, California, Water resources devel ment, Central Valley Project, Federal jurisdicti State jurisdiction, Marginal benefits, Water tribution (Applied), Cost-benefit analysis.
Identifiers: Feather River Project, Local juris tion.

There are two spheres of water developers California's Central Valley: local public agenc and federal and state producer-wholesalers. T have little interdependence. Federal-state agenc have some inherent advantages but encounte the disadvantages of being later developers. C sified economically, opportunities available federal and state agencies were: (a) numerous m ginal or submarginal opportunities for independ action; (b) a few better opportunities for augme ing local developments of rivers, which were c plicated by tangled water rights situations; and even fewer better opportunities which local ag cies had by-passed because of expense. The spheres are separately analyzed for: the level development; the character of water allocat among types, sites, and times of use; and allocat among different users of given types. In eighteen rigation districts administered by local agenc average revenue was appreciably below long- average cost. These districts have either over- located water for their own lands or maldistribu water among irrigators. Benefit-cost analyses of basic features of the Central Valley Project, the Feather River Project show that the federal state projects are equally inefficient as local p jects. (Gossen-Chicago)

criptors: *Research and development, *Water urces development, Organizations, Decision ing, Social aspects, Social participation, Invest-t, Optimization, Water utilization, Political ects, Water law.
tifiers: *Social sciences.

article identifies several topics for research. A or never-ending task is to identify significant ems and subsystems of organized social action reference to water resources, and to un-tand the dynamics and interaction of these ems. A specific problem is the jump between eria evaluation and hard decision. Fundamental ti-discipline studies in identifying appropriate sion systems in which evaluative criteria can ction are recommended. The social role of er in public and private behavior must be ified, because two conflicting concepts of water elopment exist. The one used is 'Governments st to remove water as a constraint to private elopment.' The one desired is 'We seek an nomically optimal water resource allocation in region x and time y.' The sociologist should pt the spread of 'practices research' to water in order that water shortage may be offset by cient use. Questions of social organization and handling of conflict deserve attention. Power tionships among the political entities associated water resources must be studied. Water law t be ordered. Non-monetary criteria must be er defined. All research should be carried to operational stage where possible. (Gossen-cago)

ASTAL WATERS AND THE NATION,
ional Council on Marine Resources and En-ering Development, Washington, D. C.
ard Wenk, Jr.
il Eng, Vol 39, No 6, pp 52-55, June 1969. 4 p.

Descriptors: *Planning, *Land use, Coasts, *Coastal marshes, *Beaches, Coastal plains, Recreation, Industries, Fishing, Agriculture, Management, Land resources, Urbanization, Governments, Water pollution.
Identifiers: Coastal land uses, Land use planning.

The states in the U.S. Coastal Zone contain most of the nation's population and industry, the gateway for maritime trade of about $40 billion, the staging area for the $500 million fish and crustacean industry, and the locus for the billion-dollar offshore oil and gas industry. The task is to balance 2 factors--demands for development and more subtle esthetic natural-resource and recreational needs. Each year, tens of millions of people turn to the sea for recreation. The zone as a resource is shrinking and subject to degradation: a site of marshlands ready for filling, a convenient sink for wastes (already 10% of the coastal waters are lost for shellfish culture, because of pollution), the site of an oil-tanker wreck and a runaway underwater oil well. The need is for planning--rational weighing of the demands for development against the values obtained by preservation. The Federal Government is attacking the problem by undertaking studies and by considering merits of the idea of state managed Coastal Zone Authorities to plan and regulate land and water use. The states have the lead role as they now have the legal jurisdiction over most coastal resources, but need better coordinated and stronger agencies as well as more aggressive action. (Knapp-USGS)

Identifiers: *Symposium, *Marine mineral resources, Policy considerations.

Presents 15 papers and comments resulting from the first conference of its kind. Co-sponsored by the U.S. Geological Survey, the University of Rhode Island, and the Navy, the meeting brought together representatives from science, industry, government and the military to discuss the ocean environment and the problems and possibilities in recovery of mineral resources from the ocean. The symposium was divided into 4 parts: Ocean-geologic Times, Mineral Resources, New Technology and Engineering in the Oceans, and Public Policy Questions. Included in the Proceedings are reports on marine geology of continental shelves and slopes; mineral potential including petroleum, tin, and seawater as a raw material; problems in developing minerals; and national and international considerations relating to ocean mineral resources. FUTURE WATER SUPPLY-FACILITIES, METROPOLITAN WASHINGTON REGION,
Metropolitan Washington Council of Governments, D. C. Board of Engineers.
Richard Hazen, Thomas M. Niles, Roy H. Ritter, and Abel Wolman.
Available from Clearinghouse as PB 182 307 at $3.00 in paper copy and $0.65 in microfiche. Metrop Wash Counc Governments, Board of Eng Rep No 2, Dec 1968. 74 p, 6 fig, 11 tab.

Descriptors: *Water demand, *Water supply, *Water sources, *Water distribution (Applied), *District of Columbia, Virginia, Maryland, Networks, Water sources, Water conveyance, Water delivery, Water management (Applied), Water works, Public utilities.
Identifiers: Washington D. C. Metropolitan area.

Beginning with the assumption that the recommendations presented in Report No. 1 dated May, 1967 will result in development of an adequate supply of raw water to the Region, Report No. 2 estimates the quantities of water that will be required by the various systems serving the Washington Metropolitan Region to 2010. It makes general recommendations concerning the facilities needed to meet those developing water requirements. Existing facilities of the systems are surveyed, and individual chapters are devoted to the District of Columbia, the Washington Suburban Sanitary District (Montgomery and Prince George Counties in Maryland) and the Fairfax County (Virginia) Water Authority, the three systems that supply 95 percent of the water. Attention is devoted to the need for emergency interconnections among the systems and to the extension of Washington Aqueduct service to some of the Virginia systems. Matters of organization and finance are also discussed. (Knapp-USGS)

PERCEPTION AND PUBLIC POLICY IN THE RECREATIONAL USE OF DOMESTIC WATER SUPPLY RESERVOIRS,
Southern Illinois Univ., Carbondale.
Duane D. Baumann.
Water Resources Research, Vol 5, No 3, pp 543-554, June 1969. 12 p, 4 fig, 2 tab, 31 ref.

Descriptors: *Recreation, *Domestic water, *Water supply, Reservoirs, Water management, Management, Diseases, Environmental sanitation, Legal aspects, Northeast US, Epidemics.
Identifiers: *Managerial perception, *Water pollution, *Public policy, *Recreational use, *Water managers, Consumer, Recreational activities, Social guides.

In the Northeast and Far West, recreational activities are usually prohibited from domestic water supply reservoirs. Water managers perceive recreation to be incompatible with the production of safe, potable water. Public attitudes are opposed to such reservoir use and the state health departments are influential in the formation and perpetuation of the restrictive policies and laws of recreation on domestic water supply reservoirs. In the remainder of the country, recreational activities are not only allowed on domestic water supply reservoirs, but the water managers do not consider reservoir recreation as inimical to the hygienic and aesthetic qualities of the drinking water. The public favors such reservoir use. Within each region, managerial perceptions of recreation on municipal water supply reservoirs were demonstrated to be a function of the manager's evaluation of water treatment technology, recreation as a source of pollution, managerial problems, and the economics of providing recreation. These in turn were influenced by the formal and informal social guides. From a literature review, the writer concludes that all recreational activities can be permitted on domestic water supply reservoirs without any measurable increase in the risk of water-borne disease if the water is properly treated. CLASSIFICATORY NOTES ON THE PRODUCTION AND TRANSMISSION OF TECHNOLOGICAL KNOWLEDGE,
Harvard Univ., Cambridge, Mass.
Kenneth J. Arrow.
American Economic Review, Vol 59, No 2, pp 29-35, May 1969. 7 p, 12 ref.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Descriptors: Resource development, Technology, Risks.
Identifiers: *Production of knowledge, *Transmission of knowledge, *Technological knowledge, Production function, Technological change, Factor augmentation.

Economists could leave the analysis of production function with the assertion that the causes which determine the amount of technological knowledge at any one time and place are as much outside their province as the tastes which determine consumption patterns. However, we know that significant quantities of resources are being expended by profit-making institutions on research and development. Hence, it is suggested that we must regard the body of technological knowledge as the results as well as the cause of economic changes. A model of the form: Y= F (A (t) K, B (t)L), where Y is output, K is capital, L is labor, and A (t) and B (t) are the total augmentations of capital and labor, respectively, has been suggested. Knowledge, as reflected in A and B appears as an input. It is the suggestion of this paper that such models do not capture the essential features of the creation and transmission of knowledge. Technological progress is in the first instance the reduction in uncertainty. Research and development is thus intimately connected with the problems of uncertainty reduction. Water projects, like others, are housed in uncertainty and as such, a usable model which takes into account uncertainty, would be most helpful to decision makers contemplating investments in water projects. THE FRESH WATER OF NEW YORK STATE: ITS CONSERVATION AND USE.
State Univ. of New York, Buffalo.

Wm C Brown Book Co, Dubuque, Iowa, 1967. 255 p. Lauren B. Hitchcock, Editor.

Descriptors: *Water resources, *New York, *Conservation, River basins, Water pollution, Water management, Limnology, Economics, Government finance, Water quality control, Water pollution control, Energy, Great Lakes, Legal aspects, River basin development, Hudson River, Water quality.
Identifiers: Urban planning, Long Island.

The book is composed of papers by nationally distinguished authorities in the field of water resources and others who participated in a symposium directed primarily at the challenges confronting New York State, but applicable in many cases, to water problems existing nationally and abroad. A summation was presented of where we stand today, which could help resolve some uncertainties, crystallize public opinion, and alert those in government and community life who may still view these water problems with a degree of apathy. The symposium brought together representatives of virtually all fields concerned with our water resources. These included pollution causes and control, water resources management, limnology, hydrology, economics, urban planning, and government. Emerging from this Symposium is the inescapable inference that not much will be accomplished until the federal government finances a much larger portion of the multi-billions required to construct municipal and industrial treatment works, paralleling the country's experience in its expanded program of highways. WHERE NEW YORK STATE STANDS TODAY IN WATER RESOURCES,
State Univ. of New York, Syracuse. Coll. of Forestry.
H. G. Wilm.
The Fresh Water of New York State: Its Conservation and Use, pp 3-9, Wm C Brown Book Co, Dubuque, Iowa, 1967. 7p. Edited by Lauren B. Hitchcock.

Descriptors: *New York, *Water resources, Regions, Floods, Runoff, Erosion, Sediments, Water pollution, Water storage, Water distribution, Planning, Water supply.
Identifiers: Water ownership, Water resources research.

The author discusses New York State's water resource situation, the major problems which it faces, and the steps that are being taken to meet them. The paper first investigates the general water situation in New York State, making necessary comparisons with other regions, and discussing total quantities; floods and accelerated run off, as contrasted with shortages; erosion and sediment; and pollution. Intimately tied in with these variables are the problems of shortage and distribution of water. The author then discusses the ownership of water, including some fallacies in popular conceptions of water ownership in the East. The last part of the paper deals with the various kinds of water resource planning and research that are being conducted in New York State and with activities that are essential for the immediate and more distant future, so that New York State may have ample supplies of clean usable water for the expanding population. PLACE OF WATER RESOURCES PLANNING IN ECONOMIC REGIONAL DEVELOPMENT,
Cornell Univ., Ithaca, N. Y.
David J. Allee.
The Fresh Water of New York State: Its Conservation and Use, pp 170-180, Wm C Brown Book Co, Dubuque, Iowa, 1967. 11 p, 1 fig, 1 disc. Edited by Lauren B. Hitchcock.

Descriptors: *Planning, Investment, Costs, Regions, Industrial water, Productivity, Water resources, Water utilization.
Identifiers: *Economic regional development, Social overhead capital, Growth, Substitutes, Regional growth, Recreational water use, Agricultural water development.

Social overhead capital, which includes much of the investment being planned for water resource development, is a permissive influence on growth, operating largely through the cost structure for directly productive activities. Being only a part of the effort implies that water should be coordinated with other public investment policy. Vigorous planning is crucial in a mature economy because it is probably the expectation of social overhead capacity that is an significant to private investment as existing excess capacity. Regions with relatively small economies are likely to be more concerned with export base effects of water development. Larger regions in addition have an interest in effects on shifts between sectors caused by increased productivity and income. Even when substantial increases in the volume of economic activity do not seem probable it should be possible to increase per capita incomes through increased investment and productivity. The general plea of this paper is to improve our planning analysis and particular our economic analysis, to consider more precisely growth and income distribution goals, at least, in addition to the traditional considerations of efficiency. (See also W69-08076). (Loeb-Rutgers)

Shortages.

New York State will build by the year 2000
urban economy equivalent to that achieved in t
past 175 years. In this development, water manag
ment is but one of the many factors to be acco
modated. Historically, water management h
played a relatively minor role in urban develo
ment. Rather, a laissez-faire approach has been t
predominant pattern. Only lately has the conc
of water as a resource held in public trust had mu
acceptance. Water management as a public fu
tion has been administered through a wide range
organizational forms. It lends itself to an 'aspect
function' approach and divided responsibil
among units and levels of government. The fruits
economic research will play a major role in con
tioning our future patterns and may well dictate
evolutionary pattern of organization. A major h
drance to optimal planning effort is the significa
shortage of skills and manpower. These shortag
must be resolved if progress is to be realized. (S
also W69-08076). (Loeb-Rutgers)

Formal approval of the Columbia River Treaty
1964 brought to a conclusion two decades of stu
and negotiation by the United States and Cana
for joint development of the Columbia River Bas
The Treaty provides the framework for one of t
most far-reaching water development efforts
North America. The engineering and econom

es made in preparation for international agree-
t on so complex an undertaking as the Colum-
were concerned with the selection of sites, the
g of project construction, and the division of
and benefits between the upstream and
nstream countries. The negotiations were
acted. The issues involved not only the in-
ts of the United States and Canada, but also
e of British Columbia. Also, in the course of
decades changing technological, economic,
political conditions in both countries were fac-
complicating the final decisions. In this book,
illa reviews the process by which the Treaty
e into being and analyzes the economic impli-
ns of the terms. The book, besides being an in-
ndent economic appraisal of a major un-
king in international river development, is a
study of value to future international develop-
efforts and a contribution to understanding
economics of water management. (Loeb-Rut-

The large number of government reports, commissions, symposia, and regional, national, and international conferences devoted to the subject of water indicates an emerging awareness of water as a controlling factor in economic growth. While different specialists have their own views of the 'problem,' its core lies in the growing disparity between the supply and demand for water. Our consumption of water has been growing more rapidly than the increase in population, a state of affairs that has accelerated the pressure on the water supplies of the semiarid parts of the country, notably the Southwest. As a result of the current state of militancy, the new technology of war, and the search for climatic amenities, population has been growing rapidly in those areas in which water shortage historically has been a chronic problem. The present study was prompted by presentiments that the growing shortage of water in certain parts of the country will raise a barrier against sustained economic growth and mobility, and the current experience of the Southwest, where the shortage of water has always been apparent, should help forecast what can be expected over a wider area at a later date. RESOURCES DEVELOPMENT: FRONTIERS FOR RESEARCH.
Western Resources Conference, Boulder, Colo.

University of Colorado Press, Boulder, pp 1-333, 1960. 333 p, 16 fig, 10 tab, 3 append. Edited by Franklin S. Pollak.

Descriptors: *Resource development, Irrigation, Water utilization, Electricity, Costs, Water supply, Planning, Colorado, Colorado River, Water resources development, Groundwater, Water law, Land use, Mineralogy, Energy, Recreation, Conservation.
Identifiers: *Western Resource Conference, *Atomic energy, Land policy, South Platte River, Arizona v California, River system planning.

The papers presented in this volume were originally presented at the Western Resources Conference held in Boulder in the summer of 1959, under the sponsorship of the University of Colorado, Colorado State University and the Colorado School of Mines. That conference and this book represent a decision by the three sponsoring institutions that the West needs greater knowledge about its resources and that they have a duty to provide it. They plan, therefore, a continuing program on the West's resources, dealing with both conservation and development--a program of instruction and research, supplement by conferences and publications. The topics chosen for the first conference were five major resources--water, land, recreation, resources, minerals and energy and research in relation to resources. The speakers were from a variety of organizations and occupations: universities, the Federal Government, state government and municipal government, Resources for the Future, industry, the private practice of law and engineering. POTENTIAL APPLICATIONS OF NEW WATER TECHNOLOGY IN THE WEST.
Resources for the Future, Inc., Washington, D. C.; and Wisconsin Univ., Madison. Solar Energy Lab.
George O. G. Lof.
Resources Development: Frontiers For Research, pp 39-48, University of Colorado Press, Boulder, 1960. 10 p, 2 tab. Edited by Franklin S. Pollak.

Descriptors: *Technology, Industrial use, Water reuse, Water demand, Water supply, Sea water, Atmosphere, Groundwater, Evaporation.
Identifiers: *Water technology, *Western States, Industrial re-use.

Some new or not yet widely applied methods for increasing the availability of water for men's needs may have particular importance in the Western States. These methods fall into two categories. Applicationof one group of techniques adds to our present supply by reaching new sources or obtaining greater quantities from old sources. The second set of methods permits use of our present supply more effectively. The need for considering ways to augment water availability is real and immediate since our demand for water is increasing rapidly. As such, the subject of increased water supply, through procurement of more water and the better use of existing supplies is of growing concern. The author contends that the United States is not going to run out of water or be faced with a formidable water crisis, for new technology and better and wider application of older technology is going to keep up reasonably well with the requirements. In some localities there will be major difficulties, but none should be insurmountable. The author states that it should be possible to choose a place at random and obtain water at that point, at costs low enough to make it useful for municipal supply. (See also W69-08088). WATER-RESOURCE DEVELOPMENT, THE ECONOMICS OF PROJECT EVALUATION,
Harvard Univ., Cambridge, Mass.
Otto Eckstein.
Cambridge, Massachusetts, Harvard University Press, 1958. 300 p, 15 fig, 55 tab, 134 ref.

Descriptors: *Water resource development, *Flood control, *Irrigation, *Navigation, *Electric power, *Joint costs, Project purposes, Income, Benefits, Costs, Welfare, Cost-benefit analysis, Political aspects, Social aspects, Risks, Resource allocation.
Identifiers: *Project evaluation, Bureau of Reclamation, Department of the Interior, Army Corps of Engineers, Income distribution, Harbor improvement.

This study analyzes the procedures for measuring benefits and costs employed by two major agencies which are building federal water-resource projects: the Bureau of Reclamation of the Department of the Interior and the Corps of Engineers, U S Army. The analysis is based on the theory of welfare economics. It treats benefit-cost analysis as a means of testing the quality of a project and of selecting the most desirable projects from the point of view of economic efficiency. It is assumed that judgments about changes in the distribution of income and about the political and social objectives must be left to Congress and to administrators, and that the national interest is best served by benefit-cost analyses which reveal each project's impact on the total real national income to be enjoyed by the country. This is a collection of lectures given by the author at the University of Chicago. The lectures are concerned with water resources and water power as well as the role of the several levels of government-federal, state and local--in a desirable program of

LIBRARY U. OF L. URBANA-CHAMPAIGN

conservation and development. Their purpose is to further the most economic use of water resources possible. Thus, each project must pass the test of economics in deciding whether it is waste or conservation. The book reviews past and present federal water policies with mention of the accomplishments of the different agencies. The role of the Federal government in the area of navigation, reclamation and flood control as well as the economics of federal power developments are reviewed and discussed. The book concludes with a discussion of the findings of the Hoover Commission Task Force. (Murphy-Rutgers)

THE PERCEPTION OF NATURAL HAZARDS IN RESOURCE MANAGEMENT,
Toronto Univ., (Ontario); and Clark Univ., Worcester, Mass.
Ian Burton, and Robert W. Kates.
Natural Resources Journal, Vol. 3, pp 412-441, January, 1964. 20 p, 5 fig, 5 tab, 54 ref.

Descriptors: *Attitudes, Flooding, Administration, Frequency, Water users, Scientific personnel, Rural areas, Coastal plains, Flood plains.
Identifiers: Natural hazards, Magnitude, Urban areas.

The article is a study of variations in the perception of natural hazards, and of ways in which it affects resource management. Section I defines natural hazards as elements in the physical environment, harmful to man and extraneous to him. Section II classifies natural hazards by their principal causal agent. Section III discusses the magnitude and frequency of hazards. Variations in attitude cannot be explained directly in terms of magnitude and frequency. Section IV considers within-group and between-group variations of two groups: resource users and technical and scientific personnel. Difference in perception are found between agricultural and urban flood-plain users and between coastal and flood plain users. Widespread divergency exists between the perception of flood hazard of technical-scientific personnel and resource users. Resource users often discount the possibility of recurring floods, and reject plans for protection, even when the monetary cost is non-existent. Three reasons for divergence in hazard evaluation are suggested: (1) some users reflect divergencies among scientists; (2) some diverging perceptions are based on different basic attitudes toward nature; and, (3) the mobile user need not be concerned about an area. FRAMEWORKS OF DECISION MAKING,
Chicago Univ., Ill. Dept. of Geography.
Gilbert F. White.
Johns Hopkins University, Water Management Seminars, October 1964 to May 1965. pp 331-344, 14 p, 3 tab, 1 fig, 4 ref.

Descriptors: *Water resources development, *Non-structural alternatives, *Decision making, Water demand, Water supply, Research and development.
Identifiers: *Alternative actions, Perceived needs.

The growing gap between scientific technology and practical application is acknowledged as one of the major problems confronting a solution to water resource problems. The failure of much water management in the United States is attributed to the methods by which decisions are made. This method often leads to two kinds of results: (1) failure of predictions to be realized; and, (2) ignoring opportunities for more fruitful management. The way in which a problem is stated very often determines the results achieved. One of the disadvantages inherent in most economic optimization analyses is the assumption that water managers make rational choices based on decision criteria aimed toward maximization of their profits. This method often excludes interesting alternatives which have not been canvassed but have proven feasible. Perception of needs influence choice as does estimation of the resource and perception of the technology available. The point is made that people who are using the water take a different view of how the water is managed than do the public officials. Suggested by the author is a framework for examining decisions that would be applied first to the resource managers, second to the public agency and third an idealistic framework for the 'objective' student of the situation. Two essential needs are proposed: (1) means by which can be developed greater predictive capacity to anticipate what actions will be taken by resource managers; and, (2) need for research to develop methods of finding a wider range of alternatives and examining their applications. COMPREHENSIVE, MULTIPLE PURPOSE WATER RESOURCES DEVELOPMENT,
Corps. of Engineers, Washington, D. C.
Harry A. Schwarz.
Johns Hopkins University, Water Management Seminars, pp 189-196, October 1964 to May 1965. 8 p, 4 ref.

Descriptors: *Water resources development, *River basin development, Project planning, Project purposes, Data collections.
Identifiers: *Alternative goals, Comprehensive planning.

Resource planning for an entire river basin is seen as a problem in environmental engineering. Four distinct steps are identified: (1) identifying the objectives; (2) translating these objectives into specific goals; (3) formulation of a plan; and, (4) evaluation and analysis of the plan to determine the consequences. Since objectives may be conflicting rather than complimentary, a balance must be achieved through the assignment of priorities. The author distinguishes between goals and objectives by asserting that objectives are broad, general statements and goals are measurable, specific items deduced from the broad objective. The formulation of a plan is viewed as the traditional role of engineering planning in which benefits are maximized and costs are minimized. The analysis and evaluation of the consequences of a plan should incorporate in addition to monetary costs and benefits, the social and aesthetic ones, the consequences of alternatives or of inaction, and the effectiveness of the plan in the light of the objectives. The goal of basin planning for the actual planner is described in seven steps: (1) planning for planning; (2) collection of data; (3) determination of needs; (4) determination of capabilities; (5) formulation of a tentative plan; (6) evaluation and refinement of the plan; and, (7) report on the plan. Since the final decision is usually made by some one in the political process other than the planner, the author stresses the importance of writing a plan that is simple enough to be clear to the laymen yet detailed enough for the review by expert. CONFLICTS WITHIN RECREATION: EMERGING PROBLEM IN THE ALLOCAT OF WATER AND INVESTMENT FUNDS,
Missouri Univ., Columbia; and Departmen Agriculture, Washington, D. C.
John A. Kuehn, and Durward Brewer.
Land Economics, Vol. 43, No. 4, pp 456 November, 1967. 6 p, 9 ref.

Descriptors: *Recreation, *Decision ma Water allocation (Policy), Investment, Plan Methodology, Recreation demand, Cost-be analysis.
Identifiers: Conflicting recreation demands, planning, Alternatives, Attendance model.

The purposes of this article are to evaluate the of a consistent methodology for choosing a various types of water-oriented recreat developments, and to propose some workable tions. The growing significance of recreation i tional planning is discussed. Outdoor recreatio

ticomponent project; choices must be made veen different facilities to serve various recreaists. A particular problem is the conflict veen stream and reservoir advocates. The insing demand for water recreation, the growing ortance of recreation in water usage, and the rsity among recreational activities have intend the problem of allocating water and investt funds. Norms are proposed for efficient zation of resources. Coordination of the recreal uses of a basin is recommended to satisfy as y of the conflicting demands as possible. The n is the recommended planning unit. The fong methodological standards are endorsed: (1) sideration of all alternative projects and comtions; (2) development of a predictive model estimate attendance; (3) use of benefit-cost ysis to compare future benefits with present future costs; and, (4) separation of the ning and decision-making functions from the struction function. BENEFIT-COST ANALYSIS OF LOCAL TER SUPPLY,
isiana State Univ., Baton Rouge. Dept. of nomics.
. Stober, and L. H. Falk.
d Economics, Vol. 43, No 3, pp 328-335, Au-, 1967. 8 p, 1 fig, 1 tab, 6 ref.

criptors: *Cost-benefit analysis, *Local governts, Water supply, Municipal water, Industrial r, Cost comparisons, Return to scale, Interest , Diseconomies of scale, Cost-benefit ratio.

al water resource development requires modifin of the tools which have been developed to yze federal expenditures. The paper focuses on problem of a community faced with a shortage ater for industrial and municipal use. Two alative actions exist: (1) let industrial users lop their own supplies or reduce water conption through either more efficient use or a titution for water; or (2) let the community ly water to industrial and municipal users. The parison is restricted to project financing by the of water. In formula, the cost measurements a community project and a private project are structed. Cost comparisons are drawn. A nuical example of the process is given. The efit-cost ratio will always favor the community ect if there are constant returns to scale and projects are discounted at the same interest This conclusion is a direct consequence of the orate income tax structure. A lower cost of tal to the community then to corporate water s favors the community project. Increasing ms of scale are advantageous to the community ect; diseconomies of scale lower the benefitratio. (Gossen-Chicago)

ACT OF COMMUNITY WATER SYSTEMS MALL TOWNS,
ois Univ., Urbana. Water Resources Center.
ter J. Wills, and Donald D. Osburn.
earch Report No 20, Water Resources Center, versity of Illinois at Urbana-Champaign, June 9, iii+ 16 pp. OWRR Project A-027-ILL.

criptors: *Evaluation, Illinois, Project planning r supply, Water users, *Benefits, Indirect efits.

primary purpose of this study was to describe impact the addition of a community water em to a small town would have upon that town the surrounding communities. The benefits of system were recognized by the residents and e of the first round impacts were measured. efits observed were increases in the number of r using appliances, increases in property es, improved fire protection and sanitary conns. Several factors need to be considered when ning future water systems as to the calculation uture needs of the system. Changes which can be expected in population and business activity, changes in the number of water using appliances, and other factors all need to be considered when planning for the successful installation and operation of a community water system. Ample quantities of water are available in Illinois, but intelligent planning for increasing needs, careful management of water supply, and improved waste disposal are essential. Rural people are showing increased concern and are taking action to maintain an abundant supply of clear, safe water for the future. (Betchart-Univ of Ill)

MARKET STRUCTURE AND THE STABILITY OF INVESTMENT,
Michigan Univ., Ann Arbor, Mich.
F. M. Scherer.
American Economic Review, Vol 59, No 2, pp 72-79, May 1969. 8 p, 1 tab, 8 ref.

Descriptors: *Stability, *Capital investment, *Pricing, Industrial production, Demand, Competition, Profit, Equilibrium, Supply.
Identifiers: *Dynamic stability, Industrial organization, Production capacity, Oligopoly.

This paper reports on an empirical study of the link between market structure and dynamic stability. It seeks to determine whether capital investment expenditures were more stable between 1954 and 1963 in concentrated or in atomistically structured industries. With much of water resource planning subject to fluctuations in investment outlay, the model derived here may be used by the water resource planner. The study found investment outlays to be more unstable relative to their trend values in atomistically structured industries. This greater instability was thought to be more the result of low decision-making power dispersion than excessive sensitivity to demand stimuli. (Murphy-Rutgers)

INVESTMENT AND THE FRUSTRATIONS OF ECONOMETRICIANS,
Northwestern Univ., Evanston, Ill.
Robert Eisner.
American Economic Review, Vol 59, No 2, pp 50-64, May 1969. 15 p, 7 tab, 14 ref.

Descriptors: *Resource development, *Technology, *Investment, Planning, Regression analysis, Time series analysis, Costs, Profit, Depreciation.
Identifiers: Econometrics, Theoretical relation, Cross-sectional data, Complications, Simplifications.

The econometrician interested in estimating an investment function is faced with several problems. After determining what relation he wishes to estimate he must question what measured proxies to use for the variables of the theoretical relation. At the root of the difficulty is the fact that investment is forward looking, dependent upon a relation between initial conditions and expectations of the future about which both the investment decision-maker and his econometrician are frequently ill-informed. Estimation is further complicated with the recognition that competition is not perfect. The author considers many other complications which hinder the econometrician in his task. In order to circumvent this situation one would like to simplify; however, it is not at all clear that simplification preserves the essentials of the investment relationship. The author examines some of the difficulties in his own investigation in order to show limitations in this type of analysis. The author concludes that it is a tricky business designing a precise investment relation from ex post variables which fit more or less remotely the usually expectational variables of our true investment relation. It seems highly probable that the relations in the variables we measure are unstable. As such, we might expect similar problems when estimating an investment function for water related projects. RESEARCH AND DEVELOPMENT, PRODUCTION FUNCTIONS, AND RATES OF RETURN,
University of Southern California, Los Angeles, Calif.
Jora R. Minasian.
American Economic Review, Vol 59, No 2, pp 80-85, May 1969. 6 p, 2 tab, 1 append.

Descriptors: *Technology, Resource development, Return, Regression analysis, Appreciation, Capital, Labor, Benefits, Prices, Profit.
Identifiers: *Production function, *Rates of return, Cobb-Douglas production function, Covariance model, Knowledge, Elasticity, Social return.

This paper reports the results of a study of 'rate of return' to research and development expenditures in a production function setting. Although the tenuous nature of the Cobb-Douglas type of production function was originally indicated by two independent studies in the early 1960's because of its predominance in use, the estimates are obtained by both a covariance model and by the use of a production function of the Cobb-Douglas type. The elasticity of capital and research and development are found to be respectively 0.16 and 0.11. The gross return on investment in research and development is found to be 54 percent as compared with 9 percent for capital. The estimates obtained reflect both successes and failures of research and development projects. To the extent that increased productivity, caused by research and development, is partially passed on to consumers via lower prices for goods, the author's estimate tends to reflect social returns. Water researchers could similarly use production functions in an attempt to estimate rates of return on expenditures for research and development in this area. (Loeb-Rutgers)

EFFECTS OF TAXATION ON RISK-TAKING,
York Univ. (England).
Aiko N. Shibata.
American Economic Review, Vol 59, No 2, pp 553-561, May 1969. 9 p, 2 fig, 9 ref.

Descriptors: *Risks, *Taxes, Investment, Returns, Industrial production, Capital, Labor.
Identifiers: *Risk-taking, Sales tax, Capital allocation, Consumption, Production function.

The author examines the effects of the general sales tax on the distribution of the economy's total capital between risky and sure industries. Few studies exist which analyze the relationships between the changes in the investors' choice and the changes in allocation of real capital among different risk ventures. This paper represents an attempt to construct a new model capable of analyzing the allocation processes of real capital among industrial sectors with different degrees of risk, assuming that the investors evaluate the investment returns in terms of the means and standard deviations. Having constructed such a model, the paper analyzes the effects of the general sales tax on the distribution of real capital among different industries. The study concludes that the general sales tax causes a shift of real capital out of sure industries into risky industries. Water projects are a good example of ventures with different degrees of risk and where a model capable of analyzing the allocation process of real capital among sectors with different degrees of risk would be quite useful. (Loeb-Rutgers)

LIBRARY U. OF I., URBANA-CHAMPAIGN

GOVERNMENT INVESTMENTS IN MACRO-ECONOMIC PRODUCTION FUNCTIONS (GERMAN),
Walter Wittmann.
Kyklos, Vol 22, Fasc 2, pp 297-313, 1969. 17 p, 1 tab.

Descriptors: Investment, Capital, Capital supply, Time lag, Regression analysis.
Identifiers: *Macro-economics, *Production function, Government investment, Cobb-Douglas production function, Public capital stock, Tertiary capital stock.

The author introduces the government investments into a modified Cobb-Douglas production function. These government investments and the corresponding outlays of the private sector of the economy are divided into a public capital stock and a tertiary capital stock. These stocks are introduced into the production function in addition to labor and the private capital stock. Different time-lags between the income-effect and the capacity-effect are considered. In order to cope with the problems arising from the use of regression analysis, empirical investigations generally use the production function in the linearized form, for which the rates of increases are calculated. At the same time the problem of how to find realistic statistical weights arises for the new explaining variables. The author proposes two methods and calculates one example. A discussion of some empirical problems is presented. Economic data from water projects are often fitted to the form of a production function. The Cobb-Douglas production and the CES production function are the forms often used in this sort of analysis and accordingly this article has relevance to empirical studies of water supply and production phenomena. (Loeb-Rutgers)

MARKET ALLOCATION AND OPTIMUM GROWTH,
Chicago Univ., Ill.
H. Uzawa.
Australian Economic Papers, Vol 7, No 10, pp 17-27, June 1968. 11 p, 3 fig, 9 ref.

Descriptors: *Optimization, *Resource allocation, Planning, Consumption, Investment, Capital, Welfare economics, Mathematical model, Taxes, Equilibrium, Income, Production, Prices, Economics, Resources.
Identifiers: *Economic growth, Market mechanism, Securities, Capital accumulation.

The paper compares the relationships of the growth pattern achieved under the market mechanism versus those of optimum growth with the purpose of bringing about optimal allocation of resources over time. Thus, water resource planning could make use of this theoretical resource allocation discussion. The Solow-Swan growth model is used to show that the level of consumption in a market economy is lower than the optimum level and that the rate of capital accumulation determined in the competitive market is higher than the rate which would have been required to achieve optimum growth when the aggregate capital-labor ratio is larger than the long-run stationary ratio. One of the basic techniques applied is a mathematical reformulation of the Irving Fisher theory of time preference along the lines extended by T. C. Koopmans in a number of recent papers. (Murphy-Rutgers)

PUBLIC GOODS IN THEORY AND PRACTICE: A NOTE ON THE MINASIAN--SAMUELSON DISCUSSION,
Virginia Univ., Charlottesville.
James M. Buchanan.
Jour of Law and Econ Vol 10, pp 193-197, Oct 1967. 5 p.

Descriptors: Marginal costs, Monopoly, Discriminatory pricing.
Identifiers: *Public good, *TV Signal, *Tax-financed, *User charge, Pareto optimality, Marginal evaluation, Tax-price, Joint supply, Consumers' surplus.

Minasian is correct when he states that the modern theory of public goods does not allow us to make institutional decisions about organizational alternatives independently of other considerations. Only the most naive of the theory's advocates should have made this claim although some scholars seem to have interpreted it in this sense. Minasian extends his criticism beyond acceptable limits when he suggests that the allocative norms contained within the theory are incorrect within properly constrained models. His demonstration that other considerations may be dominant in certain real-world circumstances has little relevance to the validity or invalidity of the theory of public goods. It is unfortunate that Minasian failed to separate more fully the theory of public goods from the organizational problems in the TV case. It is equally unfortunate that Samuelson chose to keep the discussion on the same ground. Finally, it is distressing that Samuelson, who could have had the better of the argument, threw his own advantage away by bringing idealogical overtones into what should be a reasoned debate. Water resources are generally acknowledged to contain a public goods aspect and as such this article has relevance to theoretical investigations of the public good nature of water supplies and resources. (Sokoloff-Rutgers)

INVESTMENT DECISION UNDER UNCERTAINTY: CHOICE-THEORETIC APPROACHES,
California Univ., Los Angeles.
Jack Hirshleifer.
Quart Jour Econ, Vol 79, No 4, pp 509-536, Nov 1965. 28 p, 10 fig.

Descriptors: *Investment, interest rate, Probability, Variability, Debt.
Identifiers: *Choice-theoretic system, *Time-preference function, *Risk aversion, *Portfolios, *Marginal utility of income, *Asset-preference approach, equity.

The object of this paper is to develop, and show some of the implications of a treatment of risk or uncertain choice that is a generalization of Fisher's theory of riskless choice over time. It provides an interpretation of Fisher's theory designed (a) to examine its character as a model of choice-theoretic structure, and (b) to introduce the firm as a decision-making unit, which Fisher treated only as atomic individuals. Alternative lines of approach to the theory of risky choice are reviewed, showing how they diverge in specification of the choice-objects of individuals. This is followed by important analytical sections, which develop a theory of uncertain choice over time in terms of comparisons between consumption possibilities in different possible dated contingencies or 'states of the world.' This has some relevance for investment decisions in water resources development projects. (Sokoloff-Rutgers)

ON MODELS OF COMMERCIAL FISHING,
Massachusetts Univ., Amherst.
Vernon L. Smith.
Jour Pol Econ, Vol 77, No 2, pp 181-March/April 1969. 18 p, 10 fig, 12 ref.

Descriptors: *Commercial fishing, Operating c Marginal costs, Competition.
Identifiers: *External diseconomies, *Reso stock externalities, *Mesh externalities, *Crow externalities, *Quadratic equation, Social cost.

In current fishing theory net return is expressed function either of effort or of number of fisher (K). Most authors assume constant long-run per fisherman, so that cost is proportional to e or (K). Also, fish price is usually assumed t constant, so that total revenue simply follows inverted U-shaped sustainable yield curve. The owner expands exploitation up to the point w net revenue is at a maximum. Under decentrali unregulated exploitation, the equilibrium effo (K) is at the point where all the rent of the fishe absorbed in cost. This theory is able to accoun the situation in which it is not commercially f ble to exploit a fishery; however, it is not ab handle the situation in which a species ma depleted to the point of extinction. This is on the more serious deficiencies in the received trine. In addition, the standard analysis does provide a dynamic theory; it is not explicit a the various types of externalities that may arise does it explicitly distinguish the effect of such ables as vessel catch rate, fish population mass vestment, and mesh sizes. Many of these critic about the need for a dynamic theory, inclusio externalities, and other closely related varia could be applied to some models of water pri (Sokoloff-Rutgers)

n an area is confronted with a water shortage,
lying more water may not always be the best
solution. And in determining what is indeed the best solution, a considerably broader range of alternatives should be considered than has been the practice, for example, in Central Arizona. However, to do an intelligent job of considering more alternatives 2 steps must be taken: (1) Research must be undertaken in a wide range of technical and non-technical matters to provide the basis for establishing alternatives and choosing among them. (2) The choice from among the most promising alternatives should be made not by technical specialists alone, but in close consultation with the public in the area affected (and who will be asked to pay the bills). The specialists should see the public as an ally, not an adversary; for one thing, the public can change the parameters of public acceptability or dollar limitations, and for another, only it can meaningfully weigh the unquantifiable factors such as the value of esthetics and of preserving unique resources. THE USE OF MODERN SYNTHESIS METHODS FOR THE QUANTITATIVE ESTIMATION OF WATER RESOURCES,
A. Le Saget and P. Prudhomme.
International Conference on Water for Peace, Vol 6, U S Government Printing Office, Washington, D C, pp 436-443, 1968. 8 p

Descriptors: *Underground storage, *Water quality, *Water resources, *Permeability, Piezometers.
Identifiers: *Simulator studies, *Optimum aquifer exploitation, Resource estimation, Rheoelectric tank, Quantitative data, Differential equations, Paris Metropolitan Area.

It was not until water needs increased past the limit of existing reserves that man became aware of the necessity of making optimum use of water resources. This led to the notion of overall resource estimation of the aquifer and basin. However, this notion must not limit itself to static in situ resource estimation; it must also include optimum storage condition determination so that the effects of feed fluctuations can be reduced. Based on this concept, the study of aquifers must go further than the mere determination of their workable reserves; it must define the respective characteristics of the aquifers in view of their optimum exploitation on a regional scale so that fluctuating resources can be adapted to varying needs. To do this, the sole qualitative description of phenomena is not enough; it becomes necessary to call upon precise quantitative methods capable not only of defining in situ reserves, but also of forecasting aquifer evolution as a function of their exploitation and feed variations. This paper attempts to show how these quantitative methods are used to achieve optimum aquifer exploitation and to define and illustrate how they should be used. (Sokoloff-Rutgers)

ARE WESTERN RECREATION RESOURCES ADEQUATE TO MEET NATIONAL AND REGIONAL DEMANDS,
Colorado State Univ., Fort Collins.
Stewart G. Case.
Resources Development: Frontiers for Research, pp 279-286, University of Colorado Press, Boulder, 1960. 8 p, 13 ref.

Descriptors: *Recreation, *Recreation demand, Recreation facilities, Population, Income, Labor mobility, Resources.
Identifiers: *Recreation resources, National demand, Regional demands, City growth, Leisure time.

The author considers factors necessary to be investigated before any decision or conclusion can be made with respect to our future needs of recreation resources. Among the most important of these are population trends, growth of urban areas, increase in leisure time, higher incomes, greater mobility, and an inventory of our resources and facilities. As for population, birth rates are difficult to estimate but it is obvious that there is going to be an increase in the number of potential user of recreation areas. As the population of the United States has increased, the average size of cities has risen from about 8,000 persons in the late eighteenth century to over 20,000 in the middle of the twentieth century. Average density in centers of population has increased by more than fifty percent. There is an increasing amount of leisure time enjoyed by almost everybody as well as an increase in real income. As such, one would expect per capita expenditures on recreation to continue to rise. The new developments in transportation will lead to increased use of recreation areas. Many of the facilities constructed during the 1930's, however, have less capacity now then they did earlier. The author concludes that the Western recreation resources are adequate to meet national and regional demands because of our rapid technological changes. Since water is an important component in outdoor recreation this article has relevance to investigation into water oriented recreation problems. (See also W69-08088). (Loeb-Rutgers)

WATER 'REQUIREMENTS': THE INVESTMENT DECISION IN THE WATER SUPPLY INDUSTRY,
Manchester Univ., (England).
J. J. Warford.
The Manchester School of Econ and Soc Studies, Vol 34, No 1, pp 87-112, Jan 1966. 26 p, 5 fig, 1 append.

Descriptors: *Water requirements, *Water supply, Cost-benefit analysis, Water demand, Prices, Elasticity of demand, Benefits, Marginal costs.
Identifiers: *Investment decisions, *North West England, *Metered consumption, Average cost pricing, Social rate of discount, Capacity, Substitutes, Externality.

Consideration of a scheme such as the Morecambe Bay Barrage, which will yield large quantities of water (estimates vary from 200 to 400 mgd) and involve a highly initial outlay (estimated at pounds 40 million, which does not include the cost of building aqueducts to the consuming areas) requires at least some notion of the value that consumers will place on the water provided. Given present pricing arrangements this information is hardly likely to be forthcoming, but without it, although we are able to choose between alternative investments in water supply, we have no grounds on which to weigh the benefits of investment in water supply against the benefits of any other form of expenditure. As provision of extra supplies becomes more costly, and as water becomes used for less and less necessary purposes, the 'requirements' concept may no longer be sufficient; more sophisticated techniques of assessing the relative costs and benefits of water supply projects are now appropriate to match scientific and engineering advances in the industry. The view that 'water is cheap at any price' is almost certain to lead to over-investment in water supply projects. (Sokoloff-Rutgers)

LEASEHOLD INTERESTS IN EMINENT DOMAIN,
Oklahoma State Dept. of Highways, Oklahoma City.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Floyd Taylor, and John Paul Walters.
Highw Res Rec, No 258, pp 8-21, 1968. 14 p, 90 ref.

Descriptors: *Leases, Rent, *Eminent domain, *Condemnation, Pricing, Right-of-way, Legal aspects, Real property, Property values, Land tenure, Value, *Land appraisal, Evaluation, Legislation, Bibliographies, Appraisals, Land ownership.
Identifiers: Land acquisition.

Condemning leasehold estates involves problems not present in condemning properties where ownership is unencumbered. Several states have reached different solutions in dispensing so-called just compensation. In some situations, immediate equities take precedence over logic and reason in arriving at just compensation. hopefully, in most applications, reason and logic, and immediate equities coincide with a finding of just compensation. Just compensation involves balancing reason and equity in determining the relative rights of the landowner and public. The right to jury trial in eminent domain cases is the most effective method of ensuring the precedence of immediate equities over cold logic and reason in finalizing the rights of the parties. Of course, the jury cannot stray far outside the bounds of logic and reason in applying a layman's sense of justice to a particular rule of compensability. Juries can rectify inequitable results of strict applications of rules of noncompensability not meeting expectations of the lay-legal conscience. Yet, the question remains as to whether this is fair to the condemning public. Hopefully, a jury's verdict will lie somewhere in the gray area between the layman's conscience and the legally defined rights of the public. (USBR)

STATE REFORESTATION PROJECTS.

Minn Stat Ann secs 84A.31 to 84A.42 (1947).

Descriptors: *Minnesota, *Forests, *Reforestation, *Conservation, Forest fires, Lakes, Streams, Wildlife, Fishing, Wildlife conservation, Management, Regulation, Local governments, State governments, Taxes, Eminent domain, Land, Ditches, Drains, Financing, Projects, Administrative agencies, Legislation, Legal aspects, Supervisory control (Powers).
Identifiers: Afforestation.

For the purpose of vesting the state with title to land suitable for the development of forests and fire prevention, for advancing afforestation and reforestation, for controlling and regulating lakes and streams, and for creating game and fish reserves, the county commissioners of any county in which such lands are situated, and upon which certain taxes are delinquent, may propose that the state take over the land as a forest project. Each such project shall be under the control of the Department of Conservation which shall make rules and regulations for the care of the forests, streams and lakes, wildlife and land. The county auditor shall certify any such land to the state auditor who shall pay the delinquent tax to the county, and the land shall be transferred to and held by the state in fee. The state shall have the right of eminent domain over any provate land within any project. (Helwig-Fla)

WILLIAMS V STATE (FLOOD DAMAGE FROM OVERFLOWING STORM SEWERS).

74 NYS 2d 647-653 (N Y Ct Cl 1947).

Descriptors: *New York, *Storm drains, *Surface runoff, *Flooding, Surface waters, Stormflow, Flood damage, Overflow, Sewers, Drainage water, State governments, Concrete pipes, Storms, Cities, Channel flow, Diversion, Alteration of flow, Manholes, Natural flow, Regulated flow, Rainfall, Judicial decisions, Legal aspects, Rainfall intensity.
Identifiers: *Act of God, Catch basins.

Plaintiff brought action against the state to recover for flood damages to his building caused by the overflowing of state-owned storm sewers alleged to have been negligently constructed and maintained. Defendant asserted that on the dates in question, there was a rainfall of unprecedented severity that could not reasonably have been anticipated and that it was such as to be deemed in law an act of God. The court held that the rainfalls were not of unprecedented severity and could not be urged by defendant as an act of God to defeat plaintiff's claim. Furthermore, from the evidence, the court was of the opinion that the storm sewers were not properly constructed and maintained and that this constituted negligence which proximately caused the overflowing of plaintiff's property. A city is not liable for an increase in flow of surface waters resulting solely from the pavement of streets, but where it collects surface water into a single channel and casts it into a stream, filling it beyond its natural capacity, and flooding an adjacent owner's land, the city is liable. The court concluded that plaintiff was entitled to recover damages. (Reed-Fla)

adwaters, Flooding, Flood control, Navigable
rs, Conservation, Legislation, Silt, Lakes, Lake
, Administrative agencies, Projects, Federal government, Water rights, Regulations, Reservoirs, Wildlife, Wild rice, Discharge (Water), Reservoir silting, Mississippi River, Sediment control.
Identifiers: Water control works, Reservoir elevation.

The existing dam and appurtenant water control works on Big Stone Lake, a public navigable waterbody, are inadequate and ineffective to conserve, control, and maintain the waters for public purpose. The works aggravate the deposit of silt on the lake bed. A project plan to remodel and complete said works has been prepared by the Commissioner of Conservation and approved by the South Dakota-Minnesota Boundary Waters Commission. The Commissioner is authorized to construct, maintain and operate said project. The Commissioner is authorized and directed to enter into a cooperative agreement with the United States to control and regulate the reservoirs in the headwaters of the Mississippi River. The purpose of the agreements shall be to regulate the elevation and the discharge of the reservoirs. The plan shall include operation of the reservoir dams so that desirable lake levels are maintained for recreation, with due consideration given to the growing of wild rice, protection of wildlife resources and maintenance of headwater, river uses and water level minimums. The plan shall anticipate abnormal inflow emergencies, navigation requirements and flood control. (Helwig-Fla)

TIDAL WATERS.

Md Ann Code Art 66C secs 262, to 268 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Commercial fishing, *Tidal waters, *Nets, Administrative agencies, Legal aspects, Legislation, Water policy, Water law, Fishing, Fishing gear, Commercial fish, Fisheries, Striped bass, Gars, Carp, Sharks, Fish management, Regulation, Reasonable use, Water policy, Equipment, Navigation, Electro-fishing, Permits, Spawning.
Identifiers: Obstruction to navigation.

Only residents and landowners may fish with nets in the tidal waters of the state. It is unlawful to take fish by the use of a gig, purse net, buck net, beam trawl, otter trawl, trammel net, troll net, or drag net except in waters of the Atlantic Ocean. With an appropriate license commercial fishermen may use up to five dip nets, hoop nets, and pound nets for taking finfish. Use of airplanes and electronic devices in tidal waters for locating fish is illegal. As regulated by the Department of Chesapeake Bay Affairs, fishing in certain striped bass spawning areas is illegal. There are a number of regulations governing commercial sale of striped bass. Pound or stake nets are limited in size and may not be used where they will impede or obstruct navigation. It is unlawful to use two or more power vessels to drag a seine and to use a seine in excess of 600 yards in length. There are a number of other restrictions relating to size and use of seines. Bow and arrow is a legal means of taking carp, garfish, bullfish and shark. (Johnson-Fla)

NATURAL RESOURCES INSTITUTE.

Md Ann Code Art 66c secs 18 through 21 (1957).

Descriptors: *Maryland, *Water resources development, *Natural resources, *Schools (Education), Conservation, Legal aspects, Legislation, Water law, Water policy, Social aspects, Administration, Education, Facilities, Fish management, Wildlife management, Surface waters, Governments, Institutions, Planning, Tidal waters, Universities.

The Natural Resources Institute is a part of the University of Maryland and supersedes the Department and Commission of Research and Education. It conducts a comprehensive research and educational program covering the nonagricultural and forestry natural resources of the state. There is emphasis on tidewater and inland resources and organisms, including fish and wildlife, and surface water of the state. It cooperates with all related agencies whether governmental or private. Its staff may collect such animals, plants and other samples and use those collecting devices, seasons, and techniques as are necessary to fulfill its purpose. The Board of Regents of the University of Maryland supervises and controls the institute. The institute's director serves as a member of the Board of Natural Resources and the Water Pollution Control Commission. (Johnson-Fla)

ROADS AND HIGHWAYS.

W Va Code Ann secs 17-17-2, 17-17-4, 17-17-5, 17-17-17, 17-17-25, 17-17-30, 17-17-31 (1966).

Descriptors: *West Virginia, *Bridges, *Bridge construction, *Ohio River, Legislation, Permits, Federal government, State governments, Local governments, Boundaries (Property), Navigable rivers, Nonnavigable waters, Streams, Locks, Contracts, Leases, Navigation, Construction costs, Cost repayment, Loans, Administrative agencies, Administrative regulation.
Identifiers: *Bridge corporations, *Toll bridges, Great Kanawha River, Big Sandy River, Obstructions to navigation, Nuisance (Public), Tolls.

Corporations may be formed to construct bridges across the Ohio, Great Kanawha, and Big Sandy Rivers in the manner provided by the U S Congress. Bridges constructed contrary to the provisions of this statute are deemed nuisances. No bridge shall be constructed so as to obstruct navigation. The state road commissioner may purchase land and construct toll bridges over any river lying wholly or partly within the state or forming a boundary of the state with the proceeds of bridge revenue bonds. No bridge shall be constructed across any river between any bridge and any bridge owned by the state and operated as a toll bridge by the state road commissioner, except under a permit of the commissioner, until a certificate of convenience and necessity is granted by the public service commission. Incorporated cities are authorized to construct toll bridges or tunnels over or under rivers from a point within the city to the opposite shore. Such cities may purchase existing bridges owned by bridge companies or corporations. (Kahle-Fla)
W69-07889

ROADS AND HIGHWAYS.

W Va Code Ann secs 17-17-2, 17-17-4, 17-17-5 (1966).

Descriptors: *West Virginia, *Bridges, *Bridge construction, *Ohio River, Federal government, State governments, Local governments, Locks, Tributaries, Channels, Standards, Navigable rivers, Contracts, Leases, Legislation, Navigation, Bridge design, Engineering structures.
Identifiers: *Nuisance (Public), *Obstruction to navigation, Bridge corporations.

Corporations may be formed and railroad corporations are authorized, to construct toll bridges across the Ohio River in a manner provided by the U S Congress. Real estate may be obtained according to law and purchases made from other bridge corporations. Subscriptions to stocks and bonds may be made by counties, districts, municipalities and other corporations. Corporations may be formed to construct bridges across the Great Kanawha or Big Sandy Rivers in like manner--provided that bridges across the Great Kanawha between the U S government lock number six and lock number three or between lock number three and a point 600 feet below the intersection of the Kanawha and Nancy's branch shall have at least one channel span, the center of which shall be the middle of the channel run by coal fleets. Such span

LIBRARY U. OF L. URBANA-CHAMPAIGN

shall have a clear opening of 400 feet at low water line and be at least 65 feet above low water. Bridges constructed contrary to the provisions of these sections are deemed public nuisances abatable by indictment of bill in equity brought by the attorney general or prosecuting attorney of the proper county. Bridges shall be constructed as not to obstruct navigation of the watercourse at any ordinary stage of water. (Kahle-Fla)
W69-07890

ROADS AND HIGHWAYS.

W Va Code Ann secs 17-17-17, 17-17-25 (1966).

Descriptors: *West Virginia, *Bridges, *Bridge construction, *Permits, Boundaries (Property), Bridge design, Public benefits, Right-of-way, Easements, Legislation, State governments, Navigable rivers, Nonnavigable waters.

The state road commissioner may construct bridges of such design and at such places approved by the state road commission over any river lying wholly or partly within the state or forming a boundary of the state. Such bridges are to be financed with the proceeds of bridge revenue bonds. The commissioner may purchase land, structures, rights-of-way, franchises, easements, and other interests in land deemed necessary for the construction of such bridges. Sections 17-17-13 to 17-17-28 are deemed alternative methods for the doing of things authorized hereby in addition to powers conferred by other laws--provided that no bridge shall be constructed between any bridge and a bridge owned and operated by the state as a toll bridge, except under written permit of the commissioner, until a certificate of convenience and necessity is granted by the public service commission. Application for such a certificate shall contain a map showing the location and design of the bridge to be built, the location of existing bridges between which the bridge is to be built, the location of public roads leading to the existing bridges and any other information deemed necessary. The public service commission before issuing a certificate must by investigation and hearing determine that there is imperative public need for such a bridge and that the revenue from any state owned bridge will not be materially impaired by construction and operation of the bridge. This proviso shall not apply where tolls from the state-owned bridge are used only for maintenance, repair and operation of the bridge. (Kahle-Fla)
W69-07891

ROADS AND HIGHWAYS.
W Va Code Ann secs 17-17-30, 17-17-31 (1966).

Descriptors: *West Virginia, *Bridge construction, *Local governments, Bridges, Construction costs, Cost repayment, Loans, Federal government, State governments, Navigable rivers, Nonnavigable waters, Streams, Regulation, Leases, Contracts.
Identifiers: *Toll bridges, Tolls.

Any incorporated city or county court of any county in which there is a portion of a navigable or nonnavigable river may construct and maintain a toll bridge or tunnel across such river from a point within the city to the opposite side of the river. No bridge may be built contrary to federal regulations or without approval of the state road commission. Bridges may be funded by bonds or from state or federal loans. Any such city or county so situated may purchase, or lease, existing bridges from any bridge company or corporation with funds from the same sources. (Kahle-Fla)
W69-07892

TOWN OF PADEN CITY V FELTON (DRAINAGE DITCH AS EASEMENT).

66 SE 2d 280-297 (W Va 1951).

Descriptors: *West Virginia, *Drainage systems, *Easements, *Surface drainage, Ditches, Judicial decisions, Legal aspects, Cities, Surface waters, Surface runoff, Drainage water, Public rights, Obstruction to flow, Prescriptive rights, Prior appropriation, Competing uses, Relative rights.
Identifiers: Injunction (Prohibitory).

Defendant owned two lots traversed by a drainage ditch carrying surface water runoff from adjacent land and streets. The ditch was cleaned intermittently by the town of Paden City. Defendant obstructed the flow of water in the ditch by accumulating debris therein which allegedly caused flooding, stagnant water, sewer overflow and damage to adjacent sidewalks. Plaintiff town sought to enjoin the interference with the water flow and to abate the alleged nuisance resulting from this obstruction to flow. Plaintiff based its claim alternately on the theories of implied dedication and easement by prescription. The court disagreed on both theories, holding that plaintiff's activities regarding prescriptive rights and rights by dedication were too isolated, sporadic and equivocal to substantiate its claim for relief. The mere use by the public of a private drainage ditch was held not to show a dedication. (Carruthers-Fla)
W69-07893

TOWN OF MEREDITH V STATE BOARD OF HEALTH (STATUTORY POWERS OF THE BOARD OF HEALTH TO ENFORCE REGULATIONS).

48 A 2d 489-496 (N H 1946).

Descriptors: *New Hampshire, *Administrative agencies, *Legislation, *Pollution abatement, Sewage disposal, Pollution identification, Judicial decisions, Water law, Water sources, Public health, Lakes, Ice, Sewage, Administrative decisions, Remedies.
Identifiers: *Injunctions (Prohibitory).

Plaintiff, town of Meridith, bordered on a lake used as a public water supply. Quantities of the town's sewerage flowed into the lake. Defendant, the State Board of Health, pursuant to its statutory authority issued orders and regulations directing plaintiff to install a public system of sewerage. Plaintiff sought to restrain defendant from enforcing these orders. The lower court certified the following questions of law, determinative of the case, to the State Supreme Court: (1) whether the orders and regulations issued by the defendant were within the powers conferred by the statutes; (2) whether the statutes conferring such powers were unconstitutional as a delegation of legislative power; and (3) whether in the exercise of such powers the defendant must comply with the notice requirements of the State's Constitution. Question one was answered affirmatively and two and three negatively. The court held that the statutes adequately provided the defendant with the power to make and compel compliance with the regulations. Furthermore, the broad grants of authority given to the board required expert investigations and findings not normally possible for the legislature to make and hence such powers to make regulations and issue orders is constitutionally delegable. Since Boards of Health act summarily, notice need not be given. (Holt-Fla)
W69-07894

GRAMMAS V COLASURDO (UPPER OWNER MAY ENTER LOWER ESTATE TO CLEAR COMMON DRAINAGE DITCH).

48 N J Super 543, 138 A 2d 553-559 (1958).

Descriptors: *New Jersey, *Prescriptive rights, *Easements, *Natural flow doctrine, Judicial decisions, Water rights, Right-of-way, Drainage, Drainage practices, Ditches, Reasonable use, Obstruction to flow, Relative rights, Natural use, Legal aspects.
Identifiers: Easements by prescription.

Plaintiff sued defendants in trespass, alleging defendants entered upon his land to widen deepen a drainage ditch. The defendants, cra ry bog owners, were preparing the ditch to re the excess waterflow incident to the sea drainage of their upland bogs. The defen claimed alternatively that they had an easeme the plaintiff's portion of the ditch, that they legal right to compel the plaintiff to remove an structions from the ditch, and that the defen had a right to enter upon the plaintiff's land to the ditch if he refused to clear it. The trial refused to offer the above instructions and th found for the plaintiff. This court reversed an manded. All of the defendants' proposed ins tions were founded upon the defendants' lon of the ditch to drain their bogs, thus making o argument for an easement by prescription. Th fendants claimed easement would extend t doing of anything that was reasonably necessa prepare the ditch for the increased flow. In circumstances, the upper owner may enter th vient estate to remove obstructions to his rig way as long as there is no breach of peace. (H Fla)

NE: BUREAU OF WATERCRAFT REGIS- TION AND SAFETY (COMPREHENSIVE TUTE REGULATING USE OF POWERED MOTORCRAFT).

38 Me Rev Stat Ann secs 231-241 (1965), 38 Me Rev Stat Ann secs 233, 234, 238, 242, 243, 244, (supp 1968-69).

Descriptors: *Maine, *Boats, *Boating regulations, Administrative agencies, Legislation, Standards, Safety, Recreation permits, Outdoor recreation, Administrative regulation, Water sports, Marinas.
Identifiers: *Power boats.

The State Bureau of Watercraft Registration and Safety is created. The Bureau's purpose is the registration of watercraft and the promotion of safety for persons and property. The bureau is empowered to adopt or amend regulations governing the use and operation of watercraft and safety equipment, including the type, quality and quantity of such equipment. All boats propelled by engines of more than 10 horsepower and all motor boats for hire must have a state certificate and display a registration number. This includes all types of watercraft whether or not engines are their principal source of power. Further provisions detail the methods for displaying identification numbers and provide that failure to produce a certificate on request is prima facie evidence of non-compliance with this article. Certain enumerated classes of motorboats are exempt from the numbering provisions. Certificated owners must notify the state upon the destruction, abandonment, removal, or transfer of ownership of their watercraft. Additional regulations cover boats available for hire. Other sections govern boat operation, regattas, and procedures governing boating accidents. (Blunt-Fla)

MOTOR BOATS, REGISTRATION, EQUIPMENT AND OPERATION.

Del Code Ann tit 23, secs 2111-2130 (Supp 1966).

Descriptors: *Delaware, *Boats, *Boating regulation, *Administrative agencies, Local governments, Legal aspects, Legislation, Boating, Water law, Water policy, State jurisdiction, Permits, Safety, Regulation, Jurisdiction, Marinas.
Identifiers: Negligence, Strict liability.

It is state policy to promote safety for persons and property connected with the use, operation and equipment of vessels and to promote uniformity of laws relating thereto. The Delaware Commission of Shell Fisheries has jurisdiction to coordinate and supervise implementation of this chapter and to issue appropriate regulations. Most boats operating on state waters must be numbered. An annual application to the Commission for such number is necessary. Motor boats fall within one of four classes and the applicable regulations vary according to the classification. Some regulations, such as the requirement of lights after sunset, are consistent throughout each class. The Commission appoints a Boat Safety Director who supervises implementation of the requirements of this chapter. Owners of boat liveries must keep the names and addresses of persons renting vessels and comply with a number of other special regulations. Special regulations apply to boats towing water skiers. Local regulations may not conflict with this chapter. A vessel owner is liable for damages negligently caused by the operator of his vessel. All peace officers of the state are responsible for enforcement of this chapter. (Johnson-Fla)

DRAINAGE.

Md Ann Code Art 66C sec 64 (1957).

Descriptors: *Maryland, *Administrative agencies, *Drainage engineering, *Drainage programs, Legal aspects, Legislation, Water law, Drainage, Drainage practices, Drainage systems, Land management, Local governments, Federal government.

The State Board of Drainage under the control of the State Board of Agriculture is created and is to be administered by the University of Maryland professor of agricultural engineering who is known as the State Drainage Engineer. The duty of said engineer is to promote and encourage drainage of agricultural lands in the state. He is also to correlate the activities of the local drainage organizations in the state and cooperates with state and federal agencies in the interest of a permanent program of improved drainage. (Johnson-Fla)

LOBSTER, TERRAPINS - DIAMOND BACK AND SALT WATER.
Md Ann Code Art 66C secs 335 thru 341 (1957).

Descriptors: *Maryland, *Turtles, *Lobster, *Regulation, Commercial shellfish, Aquatic animals, Nets, Trapping, Wildlife conservation, Commercial fishing, Legislation, Legal aspects, Breeding, Eggs, Confinement pens, Interstate.
Identifiers: *Salt water terrapins, *Diamond back terrapins, Penalties (Criminal), Closed seasons, Limits, Residence requirements, Evidence, Fines, Enforcement.

Possession, sale or transportation of spawning lobster or any lobster less than 3 1/8 inches in length, measured as prescribed, is unlawful. The taking or possession of any salt water or diamond back terrapins, skilpots or sliders from April 1 to October 31 is unlawful. The confinement of terrapins in pens for the purpose of sale or exchange during the closed season is unlawful. However, water pens may be used by dealers or for confinement for propagation purposes. Terrapin under 5 inches long may not be taken or possessed. Except for propagation purposes, the taking, destruction or possession of terrapin eggs is unlawful. No person shall take or catch terrapin mentioned in this section outside the county of his residence. The possession, or confinement of terrapins in a trap, snare, net or other device is conclusive evidence of violation. Terrapin so found may be confiscated. Violations of this section are finable misdemeanors. One half of the fines recovered shall go to any person (other than state officials charged with enforcement) who procures a conviction under this statute. (Harris-Fla)

DREDGING AND BEACHES.

Del Code Ann tit 23, secs 1701-1708 (1953), as amended, (Supp 1966).

Descriptors: *Delaware, *Dredging, *Beaches, *Construction materials, Administrative agencies, Shores, Legislation, Legal aspects, Water law, Water policy, Earth materials, Particle size, Sediments, Silts, Soils, Construction materials, Coasts, Beds, Submerged land, Regulation, Permits, Beds under water, Ownership of beds, Gravels, Construction, Sands.
Identifiers: Penalties (Criminal), Waters of the state.

It is unlawful to take such materials as earth, dirt, mud, soil, and silt, excavated from under the waters of the state, to any point out of the state. Violators may be fined and their boats or vessels are liable for those pecuniary penalties not paid. Sand, clay and other materials used in building or any other art or trade are excluded from these requirements. No sand may be taken from the beaches between Rehobath and the Maryland State Line. Permission of the State Highway Department is necessary for removal of sand from beaches elsewhere. However, persons need not obtain permission to remove gravel found between high and low water marks so long as it is of a variety suitable for concrete masonry. (Johnson-Fla)

DAMS.

Del Code Ann tit 23, secs 1901-1904 (1953), as amended, (Supp 1966).

Descriptors: *Delaware, *Dams, *Mill dams, *Riparian rights, Legislation, Legal aspects, Water law, Regulation, Jurisdiction, State jurisdiction, Permits, Dam construction, Damsites, River regulation, Water control, Bank erosion, Bank stability, Overflow, Riparian land, Riparian water loss, Streams, Washouts, Banks, Boundaries (Property), Floods, Water levels, Eminent domain.

Subject to regulations in this chapter it is legal to build dams across non-navigable waters for working any mill. No dam which would injure any upstream mill site may be built. The Superior Court has jurisdiction to authorize the building of dams in each county. When earth or gravel necessary for construction or repair of any lawful dam lies adjacent to such dam, the owner of such dam may petition to the Superior Court for condemnation of the materials. The value of such materials will be paid over to the property owner and the dam owner will be allowed to use same for the purpose set out in his petition. A dam owner may enter the land of another to repair the banks of any stream where water has been diverted from the customary banks of the stream to the detriment of the stream owner. Damages which may occur due to such entry or repair are assessable against the dam owner. A dam owner is liable for damages caused by waters forced upon the property of others by his dam. (Johnson-Fla)

DEPARTMENT OF CHESAPEAKE BAY AFFAIRS.

Md Ann Code Art 66C secs 6 thru 13L (1957).

Descriptors: *Maryland, *Administrative agencies, *Water management (Applied), *Water resources development, Commercial fishing, Shellfish, Legal aspects, Legislation, Water law, Water policy, Conservation, Fish management, Jurisdiction, Recreation, Regulation, Water conservation, Water utilization, Competing uses, Fish, Tidal waters, Planning, Area development, Economic efficiency, Permits, Mining.
Identifiers: Penalties.

The department of Chesapeake Bay Affairs is responsible for development, management, planning, and conservation of the Chesapeake Bay and all other tidal waters, the operative arm of which is the Commission on Chesapeake Bay Affairs. All matters relating to fish and shellfish and public recreation facilities in the Bay area, except matters under the jurisdiction of the Department of Game and Fish or the Department of Water Resources are within its jurisdiction. The department may also issue licenses and establish fees for certain purposes, regulate the commercial fishing industry, and perform other activities which tend to promote optimal utilization of the state's seafood resources. The mining of raw materials especially gravel, from such waters, the taking of eels, and quarantine of fish are under the control of the department. Judicial review as provided by the Administrative Procedure Act is available for challenging commission decisions. (Johnson-Fla)

LICENSING OF WELL DRILLERS.

Vt Stat Ann tit 10, secs 1151-1157 (Supp 1968).

Descriptors: *Vermont, *Drilling, *Wells, *Water resources, Logging (Recording), Drilling equipment, Underground, Well permits, Well regulation, Legislation, Administration, Administrative agencies, Subsurface waters, Drilling fluids, Water properties, Chemical properties, Physical properties, Control, Regulation.
Identifiers: Permit fees, Renewal.

Any person wishing to engage in the business of drilling wells for underground waters must apply to the state water resources board for a license. There is an annual fee for such license which must be renewed annually. Each driller must keep records on each water well drilled and file that report with the board within sixty days after the well's completion. Refusal to complete the report may result in revocation of the license. No report need be filed if the well is hand driven or dug by other manual means. Within six months of the filing of the report, the driller must file a report of the physical and chemical analysis of a sample of water from each well drilled. A water resources revolving fund is established from which payments may be made for the accumulation of water resources data and information. Any person aggrieved by a decision of the board may appeal to the county court in the county in which he has his principal place of business. (Shevin-Fla)

CONSTRUCTION OF STATUTES REQUI RAILROADS TO PROVIDE FOR DRAINAGE OR FLOW OF WATERS.
19 ALR 2d 970-972 (1951).

Descriptors: *Legislation, *Railroads, *Su drainage, *Streams, Bridges, Ditches, Cul Drains, Roadbanks, Embankments, Dikes, T Indiana, Missouri, Vermont, New York, Dam Remedies, Surface runoff, Flood damage, F ing, South Dakota, Natural flow, Obstructi flow, Diversion, Reasonable use, Relative Legal aspects, Water law, Precipitation excess

Arizona requires railroads to restore inters streams to their former state as nearly as possi as not to unnecessarily impair their use or i their franchise. Similarly, Illinois requires rail to restore intersected streams to the precon tion status quo. Iowa requires railroads to ma bridge abutments over streams in good repair. nesota requires railroad ditches and culverts clean during the period of spring thaw. Mis requires a railroad to construct and ma openings through its roadbed. New York req that intersected streams not be deprived of former usefulness. Texas, Vermont and S Dakota also base their respective statute nonimpairment of former usefulness. Gene cases construing these statutes have stress reasonable interpretation. Statutes requiring road to intersect a stream in such a manner as ford security to life and property have been h refer to life and property connected with stream and not solely that of the railroad. How a contrary interpretation has been given in struction of a similar Montana statute. (Katz-F W69-07911

ISTRUCTION OF STATUTES REQUIRING LROADS TO PROVIDE FOR THE INAGE OR FLOW OF WATERS.
LR 2d 972-974 (1951):

riptors: *Legislation, *Railroads, *Surface nage, *Streams, Bridges, Ditches, Culverts, ns, Roadbanks, Embankments, Dikes, Texas, ana, Missouri, Vermont, New York, Damages, edies, Surface runoff, Flood damage, Flood- South Dakota, Natural flow, Obstruction to Diversion, Reasonable use, Relative rights, rian lands, Legal aspects, Water law.

Missouri statute requiring construction and tenance of drainage facilities requires a rail- to construct and maintain its roadbed so as to ent injury to adjacent land. Railroads obstruct- atural drainage must take steps to prevent the low of adjacent land. The contention that the te only intended to cover cases of standing r which might be injurious to health has been ted. The Texas statute on right-of-way age has been construed to prohibit railroads interfering with natural drainage on either of the right-of-way and does not require a rail- to leave excavations on the right-of-way in condition as to prevent the accumulation of r. It has been held that these general statutes ot otherwise materially restrict the measure of otherwise imposed by law on railroads ing streams. These statutes have been termed eclaratory of the common law duty of care. z-Fla)
-07912

ISTRUCTION OF STATUTES REQUIRING LROADS TO PROVIDE FOR THE INAGE OR FLOW OF WATERS.
RL 2d 974-977 (1951).

riptors: *Legislation, *Railroads, *Surface nage, *Streams, Bridges, Ditches, Culverts, ns, Roadbanks, Embankments, Dikes, Texas, ana, Missouri, Vermont, New York, Damages, edies, Surface runoff, Flood damage, Flood- South Dakota, Natural flow, Obstruction to Diversion, Reasonable use, Relative rights, AL ASPECTS, Water law, Riparian lands, Il- s.

Illinois and Texas statutes requiring railroads rovide drainage along rights of way were ted prospectively only. The Missouri statute ly manifests a retroactive intent. The statutory of a railroad to provide adequate drainage is rally held to rest on a subsequent purchaser or r successor in ownership of the railroad. tees in bankruptcy and receivers are bound by statutory duty. The Indiana statute provides edy for adjacent landowners damaged by the oad's neglect without regard to whether the in- l parties were adjacent landowners at the time onstruction. Under Missouri law, a railroad's lity for breach of a drainage requirement te is not limited to adjacent landowners. The ouri statute has been construed to require only the railroad maintain adequate drainage cul- s to facilitate the movement of water into inter- ed streams and does not require a railroad to ntain culverts to facilitate movement of water intersected streams. (Katz-Fla)
-07913

NSTRUCTION OF STATUTES REQUIRING LROADS TO PROVIDE FOR THE AINAGE OR FLOW OF WATERS.
LR 2d 977-982 (1951).

criptors: *Legislation, *Railroads, *Surface nage, *Streams, Bridges, Dikes, Ditches, Cul- s, Drains, Roadbanks, Embankments, Texas, ana, Missouri, Vermont, New York, Damages, edies, Surface runoff, Flood damage, Flood- South Dakota, Natural flow, Obstruction to , Diversion, Reasonable use, Relative rights, rian lands, Legal aspects.

The organization of a drainage district and the levying of an assessment against a railroad does not dispose of its statutory duty to provide drainage facilities. Some general statutes require railroads to maintain openings through roadbeds to connect with ditches, drains or watercourses. Such statutes have been held not to impose a duty to so maintain culverts in the absence of a ditch, drain or watercourse with which connection is possible. A drain, ditch or watercourse does not have to be a running stream to come within the purview of several state statutes to the forgoing effect. Connecting ditches may either be natural or artificial. The statutory duty to provide drainage facilities has been limited, in several cases, to such as are practicable or may be constructed at reasonable cost. (Katz-Fla)
W69-07914

CONSTRUCTION OF STATUTES REQUIRING RAILROADS TO PROVIDE FOR THE DRAINAGE OR FLOW OF WATERS.
19 ALR 2d 982-1000 (1951).

Descriptors: *Legislation, *Railroads, *Surface drainage, *Streams, Bridges, Ditches, Culverts, Drains, Roadbanks, Embankments, Dikes, Texas, Indiana, Missouri, Vermont, New York, Damages, Remedies, Surface runoff, Flood damage, Flooding, South Dakota, Natural flow, Obstruction to flow, Diversion, Reasonable use, Relative rights, Legal aspects, Water law.

Some states impose strict liability on railroads for violation of drainage requirement statutes. However, the majority require a showing of negligence as a condition precedent to liability. Generally, the duty imposed by such statutes is continuing. The statutory duty to restore intersected streams is not limited to navigable streams. Statutes limited to the forgoing restoration have been construed not to impose liability for failure to provide surface water drainage. However, provisions specifically relating to drains, ditches and openings through roadbeds have been interpreted to impose liability for surface water runoff. The construction of bridges, culverts, drains and ditches of adequate size are satisfactory methods of compliance with these statutes. However, construction of such facilities must be in a manner calculated to avoid accumulation of drift or debris. These statutes impose a continuing duty to maintain these facilities. (Katz-Fla)

STATE SHELL-FISHERIES.
Conn Gen Stat Ann secs 26-187 to 26-237 (1960), as amended, (Supp 1968).

Descriptors: *Connecticut, *Shellfish, *Marine fisheries, *State jurisdiction, Legislation, Water law, Legal aspects, Oysters, Clams, Commercial shellfish, Mussels, Ownerships of beds, Boundaries (Property), Jurisdiction, Water rights, Administrative agencies, Local governments, Federal government, Water policy, Invertebrates, Regulation, Adjudication procedure, Boundary disputes.
Identifiers: Penalties (Criminal), Monuments, Markers, Shellfish grounds.

Five commissioners and an engineer constitute the state shell-fisheries commission which has jurisdiction over shell-fish in state waters and is vested with the power to lease certain shell fish grounds. Disputes over boundaries of shell-fish grounds must be taken to the commissioner for settlement. Fees are established for the recording of certain papers and maps including papers which evidence the transfer in ownership of oyster grounds. There is provision for release to the state of oyster grounds, leasing of beacon ground, and buoying of certain natural beds. The enforcement of shell-fish laws, taxation of shell-fish grounds, licensing of oyster vessels, and licensing to work natural beds are duties of the commission. Non-resident oystermen are regulated and there are limitations on the use of power dredges and chain bags. There is provision for designation of shell-fish spawning beds and regulation of mud dumping in waters within the commission's jurisdiction. A license is required for taking conchs and there are certain limitations on digging clams. (Johnson-Fla)
W69-07916

STATE SHELL-FISHERIES.

Conn Gen Stat Ann secs 26-187 to 26-204 (1960), as amended, (Supp 1968).

Descriptors: *Connecticut, *Administrative agencies, *Commercial shellfish, *State jurisdiction, Shellfish, Marine fisheries, Legislation, Water law, Legal aspects, Jurisdiction, Water policy, Regulation, Water resources development, Local governments, Fish management, Ownership of beds, Boundaries (Property), Adjudication procedure, Oysters, Leases, Boundary disputes, Preferences (Water rights), Boundaries (Surface).

An agency of shell-fish commissioners is established and given jurisdiction over all shell fisheries which come under state jurisdiction. Boundary disputes are settled by the Superior Court when there is a conflict between state and local jurisdiction. The commissioners must map natural oyster beds and keep a copy of same available to the public. The commission has the power to lease certain shell-fish areas. Disputes as to ownership of shell-fish grounds are to be settled by the shell-fish commissioners, and surveyors may be hired by the commission to aid in settling these disputes. Appeal of such decisions is available to the superior court. All transfers of title to oyster grounds within state jurisdiction shall be recorded in the office of the shell-fish commission. Owners of grounds designated for oyster cultivation are permitted to release their interests in these grounds to the state under certain conditions. The commission is charged with construction and maintenance of markers of shell-fish grounds within state jurisdiction. Natural oyster beds are distinguished from cultivated beds and the granting of a franchise to take clams or oysters on such beds is illegal. (Johnson-Fla)
W69-07917

STATE SHELL-FISHERIES.
Conn Gen Stat Ann secs 26-205 to 26-216 (1960), as amended, (Supp 1968).

Descriptors: *Connecticut, *Commercial shellfish, *Ownership of beds, *Taxes, Boundaries (Surface), Legislation, Water law, Legal aspects, Clams, Oysters, Shellfish, Regulation, Water policy, Administrative agencies, Water rights, State jurisdiction, Water resources development, Adjudication procedure, Jurisdiction, Financing, Permits, Dredging.

Shell-fish wardens are to be appointed by the commissioners to assist in detecting and prosecuting offenses which violate shell-fish laws. Upon application of the Oysterman's Protective Association of Connecticut or any franchise owner, shell-fish policemen may be commissioned by such association or owner to enforce shell-fish laws. For tax purposes, an owner of a franchise or grounds must deliver a sworn statement of the lot (s) owned by him in order that the value of such property may be determined. The tax rate is two percent of the valuation. Appeal from decisions of the board of tax review may be taken to the court of common pleas. Property may be sold for delinquent taxes or will revert to the state after taxes are in arrears for five years. Oyster boats must be licensed and numbered before any person can take oysters from a natural bed. Each individual upon such a boat is also required to have a license. Owners of boats and crew members must be state residents. Taking of shell-fish by use of power tools is prohibited on natural beds. (Johnson-Fla)

Identifiers: Penalties (Criminal), Mud dumping.

Size requirements are placed on the use of chain bags and net bags. Dredging without a license upon natural oyster beds renders one ineligible for a license for the remainder of the license year. A license is required for taking conchs in excess of five bushels per day. The commission may designate up to ten acre beds as shell-fish spawning areas where taking of shell-fish is prohibited. Mud or refuse dumping may be done by permit only except for work being done by the United States government. Dumping inspectors are to accompany each boat to see that its contents are properly dumped. Depositing starfish, periwinkle, or oysters other than Ostrea Virginica is prohibited. Penalties are provided for unlawfully taking oysters in daytime or at night. Owners are to buoy their shell-fish grounds properly. Oysters may not be gathered between July 20 and September 20 from any natural bed. Clams may not be taken by non-residents. No act concerning the quantity of shell-fish to be taken from natural grounds shall apply in certain specified localities. (Johnson-Fla)

With most of the functions in the water resource area being performed by government agencies, the attempt by this article to form an economic basis for deciding what type of government should perform those activities that require collective action, should prove useful to the water researcher. The present pattern of governments is duplicative and unsatisfactory. In line with this, the deficiencies of free bargaining among concerned parties in dealing with externalities in a Pareto optimal way, is discussed. A basis for a larger model is then worked out by focusing on the problem of allocative efficiency and the necessary conditions for its existence. This involves a discussion of the beneficial limits of a collective good and the boundaries of the government providing it. The author also studies the influence of economies and diseconomies of scale in the production of collective goods the effect of the scale of government on the optimal mix of governmental institutions. The conclusion warns of some of the dangers of going directly from theory to policy. (Murphy-Rutgers)

LEGAL ASPECTS FOR CONTROL OF INTRASTATE, INTERSTATE AND INTERNATIONAL WATERS,
Michigan State Assistant Attorney General.
Nicholas V. Olds.
The Fresh Water of New York State: Its Conservation and Use, pp 116-123, Wm C Brown Book Co, Dubuque, Iowa, 1967. 8 p, 15 ref. Edited by Lauren B. Hitchcock.

Descriptors: *Legal aspects, *Water control, *Great Lakes, Administration, Harbors, St. Lawrence Seaway, Water management, Federal Government, Boundary disputes, Michigan, Ohio, Lake Erie, Minnesota, Wisconsin, Navigation, Recreation, Water pollution.
Identifiers: Interstate problems, Intrastate problems, International problems, Lake levels, Ownership, Deep draft ocean navigation, International government, Pilotage, Tolls.

The Great Lakes constitutes the greatest body of fresh water in the world and is considered one of the greatest waterways. The basin encompasses eight states, two provinces and two nations. Many intrastate, interstate and international problems of a highly complex nature need to be resolved. In the past there have been boundary disputes settled both by Supreme Court decisions and interstate compacts. The international boundary has been subject to many treaties and is fixed by an International Boundary Commission. Other problems of the Great Lakes, many having economic aspects, concern lake levels, the ownership of natural resources, the construction of ports and harbors, the deepening of channels and the construction of the St. Lawrence Seaway which opened the Great Lakes to deep draft ocean navigation. It is argued that the eight Great Lakes states as well as the two Canadian provinces should play their rightful role in the management and regulation of these water resources in cooperation with federal and international governments and entities. WESTERN WATER LAW AND CONFLICTS BETWEEN THE STATES AND THE FEDERAL GOVERNMENT,
Hatfield Chilson.
Resources Development: Frontiers for Research, pp 193-202, University of Colorado Press, Boulder, 1960. 10 p. Edited by Franklin S. Pollak.

Descriptors: *Water law, Control, Water resources, Water supply, Federal Government, Desert Land Act.
Identifiers: *Western water law, *Conflicts, *Doctrine of appropriation, State control, Western States, Pelton Dam case, U S Supreme Court, Nebraska v Wyoming.

This paper deals with the water resource originating in the area of the United States lying west of the 98th meridian, commonly referred to as the Western States. Except in areas such as the Pacific Northwest, the Western States are arid or semiarid, the water supply scarce and therefore extremely valuable. Consequently, competition for the use of the limited water supply began with the settlement of the West and continues at an accelerated pace. This competition has led to innumerable controversies and conflicts among water users, and as a result there has developed in the Western States, over a period of more than one hundred years, a body of constitutional provisions, statutues, and court decisions governing water, its use and disposition. This body of law constitutes what is known as Western water law, and the backbone of this law is the doctrine of appropriation, which is discussed in detail. (See also W69-08088). (Loeb-Rutgers)

The theme for this paper was that econo should play a larger part in water allocation. O the author's basic criteria was that any law vocated must be a law that has worked in area. The author contends that the greatest for water law research is not in the cases statute books, but in the administrative offices in the field. Studies of the specific problem specific basins are needed to give us case repo a sort other than the results of litigatio economics is to play an important part in the perhaps lawyers should study economics economists should study law. An important st this direction, and in the direction of specific dies of particular basins, has been undertake the Western Regional Research Committee W financed by the Federal Government and coop ing state agricultural experiment stations. Mo this is needed. If administrators are to c master plans for water resources and are to ch intelligently between competing projects, they need economic and legal help. (See W69-080 (Loeb-Rutgers)

THE STUDY OF WATER RESOURCES GANIZATIONS AS POLITICAL SYSTEMS,
Michigan Univ., Ann Arbor. Dept. of Poli Science.
Robert H. Pealy.
Johns Hopkins University, Water Manage Seminars, pp 236-252, October 1964 to May 1 17 p, 23 ref.

Descriptors: *Political aspects, *Water resou development, river basin commissions, Motiva administrative agencies.
Identifiers: Ideology, Arkansas-White-Red Ba Inter-Agency Commission, U.S. Study Com sion, Southeast River Basins.

The thesis, that governments are political syst and organizations, and that organizations government and, therefore, political systems, i amined vis-a-vis water resource organizations. author contends that water resources planning development functions may be in part governe a political or functional sub-culture and that sub-cultures have a great deal to do with policy comes. The article is based on the proposition there is a legitimate sphere for the operatio political phenomena in water resources orga tion, and that the study of this phenomena ca profitable. Recent research indicates that m changes in formal organizations and struct would make rational planning for the develop of water resources possible. However, institut (i.e., Congress, water agencies, and clientele) r major changes with the result that only increme changes have occurred. While these increme changes have cumulatively produced substa changes, there has been little effort to syste cally evaluate the effects or the efficiency of t changes. The author takes issue with the wi

notion that if only political forces could be nted from interfering, plans and projects that benefit the public interest would ensue. A dology is developed for analyses of water rce organizations that is based on role analysis mining the policy process. The major policies ee organizations are described and analyzed: Arkansas-White-Red Basins Inter-Agency nittee (AWRBIAC); Texas; and Southeast Basins. The findings presented the influences e expectations, orientations, ideology and ptions of relevance in the making of policy in resources organizations. (Starr-Chicago) 08100

ER RESOURCES LAW - POLICIES, HANISMS AND DOCTRINES,

E ASPECTS OF PUBLIC ORGANIZATION WATER MANAGEMENT,
use Univ., N. Y. Dept. of Political Science.
e C. Martin.
Hopkins University, Water Management ars, pp 253-263, October 1964 to May 1965. 11 ref.

iptors: *Regional analysis, *Administrative ies, Federal project policy, Inter-agency ration, St. Lawrence River Commission, Ten- Valley Authority Project, Water resources pment.
fiers: *Special districts.

rticle is a discussion of water management as ucial step in a water program. An examina- f the governmental organization available for management responsibilities is done and an ption is made that water resources adminis- n is a new function of government and one is extremely difficult to fit into the tradi- framework of government. Regional ad- ration as at least a partial answer to the ems of water management is considered. The em of defining a region is noted -- a geog- r views a region differently than a public ad- rator. The author defines a region as an ad- rative region, one that does not fit into the onal pattern of government in this country. resources management regions, for the sake s examination, are divided into four major ories: (1) intrastate action; (2) interstate ac- (3) federal regional water agency (TVA) -- watershed; and, (4) international agreement awrence). Recognized are the limitations on gion as a geographical basis for public or- ganization. Because there is nothing better available, special ad hoc arrangements handle most water resources management efforts. These are usually single-purpose special districts. No viable alternative to the special district has been proposed so this trend is likely to continue. (Starr-Chicago)

WHY MANAGE WATER,
Johns Hopkins Univ., Baltimore, Md.
Abel Wolman.
Johns Hopkins University, Water Management Seminars, pp 3-12, October 1964 to May 1965. 10 p, 4 ref.

Descriptors: *Federal project policy, *Institutional constraints, *Political aspects, *Social aspects, Tennessee Valley Authority Project, Benefit-cost ratio.

The dominant hypotheses in the history of water development are reviewed from the emphasis upon economics in the interval from 1930 to 1940 to the present emphasis upon water quality. An analysis of past and present development indicates that the use of water must be a function of time and of the social purposes of the era. The management problems of water are described as being involved in kenetic planning -- any static plan for present and future objectives is marked for failure. At the present time the benefit-cost ratio may no longer be as valid a basis for water management to meet pressures of a socio-political nature. The TVA direction of total basin management and control is cited as a successful effort whose example has not been transferred to other river basins in the United States. The river basin as a topographic and hydrologic unit is seen as having validity but whether it provides a logical way to provide economic, political and social development is doubtful. The author predicts that regional emphasis may dislodge basin emphasis. Meter problems in metropolitan complexes are intensified not because of a shortage of water but because of lack of machinery for management and finance, which stems from lack of previous planning and from the existence of multiple responsibilities and competitive political units of government. National water policy is seen as developing in an ad hoc fashion and tempered by political doctrines and presents the greatest challenge for improvement to the professional. (Starr-Chicago)

WINDFALL GAINS FROM TRANSFER OF WATER ALLOTMENTS WITHIN THE COLORADO-BIG THOMPSON PROJECT,
Economic Research Service, Washington, D. C.; and Colorado State Union, Fort Collins.
Raymond L. Anderson.
Land Economics, Vol. 43, No 3, pp 265-273, August, 1967. 9 p, 6 ref.

Descriptors: *Allotments, Water rights, Legislation, Economics, Economic justification, Water utilization, Economic efficiency, Third party effects, Marginal utility, Domestic water, Irrigation water.
Identifiers: *Windfall gains, Colorado-Big Thompson project.

The paper defends existing legislation that allows owners of water rights developed under government financed projects to capture a windfall gain when they sell property. The paper evaluates the argument for recapturing windfall gains for the government. If an allotment holder no longer has use for the water and desires to sell it, he should not gain a windfall; however, very seldom does an allotment holder have no further use for his water. Selling an allotment is a negotiation between users, not a user and a non-user. The purposes of the Colorado-Big Thompson project are not violated by the transfer of allotments. Efficiency gains from transfer are discussed. So long as third parties are unaffected by trade, trading of allotment will tend to the greatest possible efficiency. The economic argument for allowing continued transfer of Colorado-Big Thompson allotments is based on marginal value. Whenever marginal value in use is greater in one employment than another, resources should move from lower value uses to higher value uses. Domestic water users in the Colorado-Big Thompson project have a considerably higher valued demand than irrigation users. (Gossen-Chicago)

Identifiers: Economic growth, Developing countries, International projects.

Development has always carried a connotation of something necessarily good and representing progress. Little thought has been given to environmental problems arising from development. The price of development has included pollution, loss of farmland and habitat for people and wildlife, and the spread of disease. Some environmental disruption is unavoidable in development, but ecological studies and careful-planning case histories show destructive consequences from development in the Amazon Basin of Brazil, the Kariba Dam between Zambia and Rhodesia, the Aswan High Dam in Egypt, the Canete Valley of Peru, and the Oceanic Islands. A 3-day conference was held near Washington, D C, in 1968, on the ecological aspects of international development. The divergent views on conservation and exploitation expressed at the meeting by agricultural scientists, ecologists, and economists are summarized. (USBR)

Descriptors: *Biomass, *Productivity, *Yield equations, Optimization.
Identifiers: *Productivity models, *Exploited populations, Resource management, Population ecology.

In the face of an expanding population, resource management will depend on precise estimates of the production of renewable natural resorces and determination of how maximum levels of production can be attained and maintained. A review of examples of exploited populations presents certain problems common to all: maximization of a sustainable yield, harvesting techniques, rhythmic cycles in productive systems, time lag between manipulation and results, differing rates of efficiency, the multiplicity of factors governing biological productivity, and the multiplicity of causal pathways by which productivity is modified. The maximum biomass yield that is repeatedly sustainable per unit time is equal to the total biomass produced in that interval minus that biomass needed to guarantee replacement of the yield in the next interval of time. A sample set of equations is developed for this relationship, leading to a yield equation which incorporates density effects on fecundity and reproduction. An introduction to the mathematical literature in optimization and maximization procedures is given. (Voigtlander-Wisc)

THIRTY YEARS EXPERIENCE WITH FIELD INSTRUMENTATION OF EARTH DAMS,
Bureau of Reclamation, Denver, Colo.
Fred C. Walker.
Pap, 18th Annu Soil Mech Conf, Lawrence, Kans, Mar 1969. 20 p.

Descriptors: *Earth dams, *Instrumentation, Dam design, Dam failure, Dam foundations, *Performance tests, Performance, Structural behavior, Earthquakes, Measuring instruments, Settlement, Pore pressure, Seepage, Field tests, Piezometers, Benefits.
Identifiers: Rapid drawdown.

The 3 main reasons for instrumenting an earth dam are: (1) to learn whether the structure performs as anticipated, (2) to monitor the continuing performance, and (3) to increase the knowledge of forces that act on a structure. Much sophisticated and exotic equipment is available for research instrumentation, but a simple instrumentation system is adequate for most routine structures. Collecting and evaluating performance data are continuing operations. The process produces critical and interesting data so infrequently that without special effort an installation may be neglected or abandoned before an event occurs that produces significant results. An earth dam has 3 principal properties whose variation during the life of the structure is of interest: resistance to water movement, resistance to deformation, and strength. The general principles by which data collected from an instrument system can be analyzed to produce an understanding of behavior are described. A few of the more noticeable behavior observations are described and opportunities for further expansion of structural behavior through structure instrumentation are listed. (USBR)

SOME CONSIDERATIONS ON THE EMPLOYMENT OF TENSIOMETERS (FRENCH),
Toulouse Univ. (France). Institut de Mecanique des Fluides.
L. Sormail.
Bull Int Ass Sci Hydrol, Vol 14, No 2, pp 79-94, June 1969. 16 p, 7 fig, 3 tab, 8 ref.

Descriptors: *Tensiometers, *Soil moisture meters, Moisture tension, Instrumentation, Research and development, Moisture content, Soil moisture, Calibrations, Measurement.
Identifiers: Tensiometer calibration and testing.

The interpretation of tensiometer measurement requires special knowledge of the mechanics of equilibrium of the tensiometer with its environment. The classical concept of response time of the system consisting of a porous cup and a manometer can be improved by taking into account the elasticity of the tubing. The role of entrapped air in the circuit is analogous to tubing elasticity. In general, it is possible to study the response characteristics of the tensiometer by imposing pressure steps on the system and by studying the equilibrium response. Such tests showed certain anomalies of behavior which can be attributed to very small bubbles of air entrapped to the internal wall of the porous cup. However, it is necessary to check the response of the tensiometer when it is placed in the soil. This is confirmed by analysis and experiments in sandy and clay soils. (Knapp-USGS)

A MATHEMATICAL FUNCTION FOR DESCRIBING CAPILLARY PRESSURE-DESATURATION DATA,
Manitoba Univ., Winnipeg. Dept. of Agricultural Engineering.
G. E. Laliberte.
Bull Int Ass Sci Hydrol, Vol 14, No 2, pp 131-149, June 1969. 19 p, 11 fig, 2 tab, 7 ref.

Descriptors: *Soil water movement, *Statistical models, Capillary conductivity, Drainage, Hysteresis, Capillary action, Probability, Porosity, Pores, Saturation, Moisture content.
Identifiers: Probability density function.

The equations of Brooks and Corey for relating effective saturation to capillary pressure describe experimental data quite well for small values of saturation but overestimate pressure as saturation approaches unity. Using assumed functions for the distribution of pore volume with respect to pore radius, Brutsaert was able to describe experimental data satisfactorily, provided that constants such as mean pore radius and the standard deviation of pore radius were determined from distribution functions derived from experimental data, rather than from the assumed functions. White developed a mathematical model which described experimental data satisfactorily but the technique required the determination of 13 constants describing the relationship. In this paper, a pore-volume probability density function is introduced which permits the development of a function for describing effective saturation in terms of dimensionless capillary pressure, that is, capillary pressure scaled in terms of bubbling pressure. The capillary pressure-saturation data on the drainage cycle are described better by the new function than by the equations of Brooks and Corey. The correspondence between experiment and theory is better at small values of saturation than for values approaching unity. The relationship between saturation and pressure is characterized by 3 constants, each of which is, in turn, a function of the pore-size distribution index. Two of the constants are related to mean pore radius and to the standard deviation of the pore-volume distribution. (Knapp-USGS)

ULTRASONIC FLOWMETERS FOR MEASURING RIVER TURBULENCE,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Yasuo Ishihara, and Shoitiro Yokosi.
Bull Disaster Prev Res Inst, Kyoto Univ, Vol 18, Part 3, No 144, pp 49-64, Feb 1969. 16 p, 17 fig, 2 photo, 9 ref.

Descriptors: *Flowmeters, *Turbulence, *Ultrasonics, Turbulent flow, Instrumentation, Eddies, Streamflow, River flow.
Identifiers: Ultrasonic turbulence meters.

Two kinds of ultrasonic flowmeters have been developed for the precise measurement of turbulent velocity in streams. One is based on the circuit transit-time method, and the other on the method of phase difference. The circuit transit-time method is able to measure 2 components of velocity simultaneously. These flowmeters have a number of excellent features: high sensitivity, low inertia, complete linearity, high stability, and independence of temperature variation. The characteristic size of the sensor of both flowmeters is only

LIBRARY U. OF L. URBANA-CHAMPAIGN

3 cm. An adequate combination of the sensors of both flowmeters makes it possible to measure 3 components of turbulent velocity simultaneously. The principle of operation, instrumentation, calibration and several problems are described. The effect of sensor size and the duration of observation on measured spectrum are discussed and a brief description of observations using the flowmeters is presented. (Knapp-USGS)

TIME SERIES ANALYSIS OF HYDROLOGIC DATA,
Arizona Univ., Tucson. Office of Hydrology and Water Resources.
Chester C. Kisiel.
Advance in Hydroscience, Vol 5, pp 1-119, 1969. 119 p, 54 fig, 10 tab, 171 ref.

Descriptors: *Statistical methods, *Model studies, *Stochastic processes, *Time series analysis, *Hydrologic aspects, Computer models, Statistical models, Linear programming, Fourier analysis, Correlation analysis, Regression analysis, Synthetic hydrology.
Identifiers: Spectral analysis, Harmonic analysis.

The use of time series analysis for the study of hydrologic data is discussed in a thorough introduction to mathematical model-making techniques. A bibliography of 171 references is included. Spectrum analysis is a powerful tool for the organization and implementation of field data collection programs. Time series analysis techniques recognize the variability of natural events and the presence of noise. Model studies must incorporate much of the complexity of natural events and detect nonlinear and nonstationary components of natural processes; however, many problems may be studied by the simplifying assumption of stationary stochastic inputs into linear time-invariant systems with stationary stochastic outputs. Identifiers: Belle River Basin (Mich).

The water resources of the Belle River Basin, southeastern Michigan are described in a 1-sheet hydrological atlas consisting of maps, graphs, tables and text. Streamflow is summarized and tabulated. Groundwater is obtained mainly from glacial drift deposits, in which yields may be over 100 gpm. Bedrock wells in the western end of the basin yield as much as 100-500 gpm, and in the eastern end yields are commonly less than 10 gpm. Some water from bedrock wells in the eastern part of the basin is too salty for most uses. (Knapp-USGS)

ifiers: Network analysis.

T Simulation is a new technique for coping uncertainty and instability of time estimates in early stages of project management. Large plex PERT networks with several closely timed al paths have a high probability that the actual al path may shift several times during the se of project work. Standard PERT analyses ased upon estimates of mean activity duration s and give little information on what happens if activity time varies. PERT Simulation incor-tes the variance or uncertainty of actual dura-time into the analysis by a probability distribu-for duration time. The likelihood of critical shifting is evaluated by determining the rela-probabilities of each network activity and of alternative path becoming critical. The trans-ation of the standard PERT model to PERT lation is described; some key points are noted etwork analysis under this system. Two exam-of applications are given. Advantages and observations regarding the use of PERT lation are listed. (USBR)

RIVER DIVERSION FOR BOUNDARY DAM,
Bechtel Corp., San Francisco, Calif.
Adolf A. Schilling.
Prepr 787, Amer Soc Civ Eng Annu Meet Nat Meet Water Resour Eng, New Orleans, La, Feb 1969. 25 p, 12 fig.

Descriptors: *Diversion, *Diversion structures, *Diversion tunnels, Diversion works, Diversion dams, Cofferdams, Arch dams, Tunnel linings, Underground powerplants, Tunnel plugs, *Tunnels, Intake structures, River closures, Gunite, Blasts, Construction.
Identifiers: *Overtopping, Boundary Dam (Wash), Blasting.

Diverting the Pend Oreille River at Boundary Arch damsite, Wash, was accomplished by constructing 2 rockfill cofferdams and a 42-ft horseshoe tunnel in the left abutment. Although this scheme followed generally accepted practice, several unique features were incorporated in the design and construction. Tunnel excavation was performed from the inside of the arch dam abutment via an adit from the underground powerplant, leaving a rock plug at each tunnel portal. Opening the portals and rerouting the river was accomplished by a series of singular rock blasts. The tunnel floor was left unlined; gunite was applied to the side walls and roof to improve hydraulic performance. The capacity of the diversion scheme was limited to river discharges during the low flow periods; flood flows were discharged over the partly completed arch dam. The diversion tunnel was closed by lowering a counterbalanced, arched, steel gate into the flow at the tunnel during diversion; a second plug sealed the diversion tunnel after closure. (USBR)

DIVERSION WORKS, SNETTISHAM PROJECT,
Corps of Engineers, Anchorage, Alaska.
Thomas E. Munsey.
Prepr 824, Amer Soc Civ Eng Annu Meet Nat Meet Water Resour Eng, New Orleans, La, Feb 1969. 17 p, 8 fig, 5 ref.

Descriptors: *Diversion works, *Diversion, *Diversion tunnels, Lakes, Alaska, Outlet works, Outlets, Hydroelectric power, Underwater construction, Underwater television, Core drilling, Tunnels, *Tunnel construction, Instrumentation, Tunneling, Joints (Geology).
Identifiers: Outlet tunnels, Underwater explosions, *Rock traps, Underwater photography, Snettisham Proj (Alaska).

The Norwegian method of lake piercing is being used to temporarily lower the water surface of a southeastern Alaska lake 130 ft below its natural level. After the surface drops, a power intake works will be constructed just above the low-water level, making available for hydropower development 110,000 acre-ft of natural storage which would have been lost had a more conventional means of diversion been used. Preliminary exploration included core borings, soundings, and examination with an underwater TV camera. Design and final profile of the tap, rock trap, and outlet tunnel are described. To illustrate typical problems in lake piercing, an account of the excavation of the most critical portion (the last 100 ft of the tunnel and rock trap) is given. Alterations in the tapping setup and procedure are the rule rather than the exception during construction. (USBR)
W69-07787

FACTORS OF SAFETY IN THE DESIGN OF BURIED PIPELINES,
Iowa State Univ. of Science and Technology, Ames.
M. G. Spangler.
Prepr ERI 359, Annu Meet Highw Res Bd, Nat Res Counc, Jan 1969. 17 p, 6 ref.

Descriptors: *Safety factors, *Safety, *Pipelines, Pipes, Design, Soil pressure, Pressure distribution, Lateral forces, Ultimate loads, Bending moments, *Concrete pipes, *Steel pipes, Loads (Forces), Shear strength, Shear stress, Structural design, Reinforced concrete, Culverts.
Identifiers: Pipe bedding, Pipe cover, Pipe cradles, Flexible pipes, Pipe laying, *Pipe design, Soil-structure interaction, Ultimate strength.

Factor of safety may be broadly defined as the ratio of the maximum load that a structure is capable of supporting to the load that the structure is designed to carry. This ratio may be determined and expressed in many ways. A factor of safety of unity is recommended as being adequate and economical for reinforced concrete pipe installations designed on the basis of the minimum 0.01 in. crack 3-edge bearing test strength of the pipe. When designing on the basis of the ultimate test strength, a factor of safety of 1.5 should be used. For nonreinforced rigid pipes, a factor of safety of 1.5, based upon the minimum ultimate test strength, is recommended for general design application, with possible reduction to 1.4 or 1.3 in unusually favorable circumstances. A limiting deflection of 5% of initial diameter is recommended for flexible metal pipe installations. This is approximately one-fourth (factor of safety of 4) of a critical deflection of 20%. The design of longitudinal bolted seams in flexible metal pipes should be based upon the ability of the seam to carry a composite of shear and bending moment stresses and not on shear strength alone. (USBR)

HYDRAULIC DESIGN OF LARGE SURGE TANKS FOR PUMPING PLANTS,
California State Dept. of Water Resources, Sacramento.
Ravinder K. Jain, Roy T. Nakahara, and John W. White.
Tech Memo No 38, Dept Water Resour, Calif, Nov 1968. 30 p, 9 fig, 1 tab, 5 ref.

Descriptors: *Surge tanks, Water hammer, *Hydraulic design, Pressure, Transients, Discharge lines, Energy losses, Graphical analysis, Surges, Hydraulic structures, Pumping plants, Orifices, Analysis.
Identifiers: Tehachapi Pump Plant (Calif), *Pressure waves, *Water column separation.

The hydraulic design of large surge tanks is described, placing emphasis on designs used for the Tehachapi surge tank. Graphical and analytical methods for determining the size of large surge tanks for pumping plants are given. Energy loss coefficients for different orifice configurations tested are included. Surge tanks are used to control transient pressures and to prevent water column separation. Flow in discharge lines communications with the surge tank through orifices connecting discharge lines with the tank. Normal operationproduces changes in flow rates in discharge lines, resulting in positive or negative transient pressure waves reflected at the surge tank as minor fluctuations in water surface elevation protecting discharge lines and downstream tunnels from these surges. During emergency conditions all pumps could be shut down at once by a power failure. This condition causes the pumps to halt, changing rotational direction as soon as water begins to flow back. The reverse flow continues until the downstream valves are closed. To prevent low pressures in discharge lines or water column separation under this condition, water is supplied from the surge tank. (USBR)

oncept of controlled flow in open channels is luced. A method of analysis is presented, ing the motion of valves or gates to be ied so that the unsteady flow in the period en initiation of the first control movement and the final movement is determined completely. When final control motion ceases, the flow is steady along the entire channel length. Theory is presented and examples are given showing application of the concepts to specific problems. Restrictions on the method and assumptions in the theory are discussed. The standard characteristics method of analysis provides a check on the gate stroking theory for specific problems. Controlled free-surface flow provides design procedures for the theoretical determination of gate or valve movements to control unsteady open-channel flow. If an on-line computer is used in a canal system, input data regarding the instantaneous conditions in the channel, together with input or stored data pertaining to normal operational methods and responses to emergency conditions, can be analyzed in a few seconds. Computed results are then available for real-time computer control. (USBR)

LABORATORY TESTS OF A MAGNETIC FLOWMETER,
Vevey Engineering Works Ltd. (Switzerland).
J. Chappuis, and J. C. Chavan.
Water Power, Vol 21, No 2, pp 60-64, Feb 1969. 5 p, 5 fig, 1 tab, 9 ref.

Descriptors: *Flow measurement, *Flowmeters, *Flow rates, Fluid flow, *Water measurement, Measuring instruments, Instrumentation, Hydraulic equipment, Hydraulic laboratories, Laboratory equipment, Laboratory tests, Hydraulic machinery, *Velocity meters.
Identifiers: *Magnetic flow meters, Foreign testing, Switzerland.

A magnetic flowmeter was tested for use in a hydraulic machinery laboratory. The test program included: (1) determining the discharge coefficient under various flow rates, (2) calculating the mean deviation of repeated measurements, (3) observing instrumental drift, (4) noting effects of external environmental conditions on measurements such as temperature and electrical fields, and (5) checking the stability of the supply circuit. The flowmeter was calibrated in the laboratory with a volumetric tank and a switching valve. Tests showed consistency of the discharge coefficient and a mean deviation of plus or minus 0.35%. No drift of the value of the discharge coefficient with time was observed; the absolute value of the coefficient agreed within 0.08% of the coefficient calculated by the indirect method. The magnetic flowmeter can be used successfully in a hydraulic machinery laboratory. (USBR)

PLANNING AND SIZING OF THE GRAND COULEE THIRD POWERPLANT,
Bureau of Reclamation, Boise, Idaho.
Harold T. Nelson.
Pap, Amer Soc Civ Eng Water Resour Eng Meet, Power Div, New Orleans, La, Feb 1969. 36 p, 14 plate.

Descriptors: *Hydroelectric plants, Hydroelectric power, *Planning, Electric generators, Grand Coulee Dam, *Electric power, Washington, Columbia River, Electric power costs, Electric power demand, Peaking capacities, Economics, Optimum development plans, Benefits, Aesthetics, Construction costs, Architecture.
Identifiers: *Grand Coulee Powerplant (Wash), Columbia Basin Project (Wash).

Significant evolutionary planning steps leading to the selection of total plant capacity and size of units for the Third Powerplant, Grand Coulee Dam, Wash, are discussed. These planning steps cover a time span from 1951 through 1968, wherein sizes of units examined were from 108 mw (as rewound to 125 mw), 300 mw, and 600 mw, with corresponding Third Powerplant capacities ranging from 1000 to 7200 mw. The result is an on-going construction program calling for the necessary modifications to the existing structure, and the design, construction, and installation of a first stage of six 600-mw units, followed by a second stage of 6 additional 600-mw units. The plan calls for rewinding existing units and future installation of 6 pump turbines having a possible total installed at-site capacity of 9771 mw by 1992. The background of certain factors influencing the selection of the size of plants and units in the existing installation is presented, which, when combined with very important recent-year hydrologic, political, and technical developments in the power generation and transmission fields, led to the establishment of the Third Powerplant program. DIGITAL COMPUTERS FOR HYDROELECTRIC POWER STATIONS,
Brown, Boveri and Co. Ltd., Baden (Switzerland).
A. Blum, and F. Frischenschlager.
Brown Boveri Rev, Vol 55, No 9, pp 553-559, Sept 1968. 7 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Digital computers, *Hydroelectric plants, *Automatic control, Hydroelectric power, Data processing, Networks, Electronic equipment, Data transmission, Pumped storage, Reservoir operation, Foreign research, Water management (Applied), Faults (Electrical).
Identifiers: *Interconnected systems, Switzerland, Telecommunication systems.

As the use of automatic control becomes more widespread and interconnected groups of power stations and distribution networks become more extensive, the need for measuring and regulating equipment becomes progressively greater. Central digital computers are required for collecting data and measurements and, depending on the degree of automation, intervening in the control processes. All steps taken toward applying automatic control more extensively in power supply systems are aimed at improving cost effectiveness and reliability of ever larger and more complex installations

LIBRARY U. OF I., URBANA-CHAMPAIGN

and relieving qualified staff from monotonous jobs. In the event of faults, the limited capabilities of a human operator can have serious consequences in a large installation if no suitable automatic control system is available to initiate the necessary measures quickly enough to protect the plant. Functions of data processing systems in the automatic operation of hydroelectric powerplants are discussed. (USBR)

EHV PIPE-TYPE CABLE INSULATED WITH SF6 GAS,
Central Research Inst. of Electric Power Industry, Tokyo (Japan).
S. Fukuda, H. Okamoto, and T. Udo.
Conf, Progr Overhead Lines Cables 220 kv Above, Inst Elec Eng, London, Great Britain, pp 338-344, Sept 1968. 7 p, 2 fig, 2 tab.

Descriptors: Extra high voltage, *Electric cables, *Experimental data, Heat transfer, *Electric insulation, Electric currents, Gases, Epoxy, Resins, Dielectrics, Electric potential, Foreign research, Steel pipes, Stainless steel, Aluminum, *Conductors, Electric arcs, Electrical properties.
Identifiers: *Pipe-type cables, *Sulfur fluorides, Test results, Japan, Dielectric properties, Experimental design, Gas-pressure cables.

Tests made on 3 sets of experimental pipe-type cables insulated with SF6 gas are described and results given. The cable sets were designed as single-core transmission circuits capable of carrying 2500 mva at 275 kv and 5000 amp. One set, a single-phase cable with a steel conductor in a steel pipe, was given voltage withstand tests only. The other 2 sets were 3-phase cables, one using aluminum conductors in aluminum pipes and the other using aluminum conductors in stainless steel pipes. All 3 sets were insulated with SF6 gas at a pressure of 5 kg/sq cm and had epoxy resin or porcelain annular (doughnut shaped) solid spacers for centering the conductor within the metallic outer pipe. Design data for each test cable are tabulated. Questions not resolved by these tests are: (1) heat transfer characteristics when installed underground, and (2) thermal expansion of cable and counter-measures against earthquakes. (USBR)

OVERHEAD LINE INSULATORS FOR IMPROVED RADIO INTERFERENCE PERFORMANCE,
Steatite and Porcelain Products Ltd., Stourport-on-Severn (England).
C. H. W. Clark.
Conf, Progr Overhead Lines Cables 220 kv Above, Inst Elec Eng, pp 17-22, London, Great Britain, Sept 1968. 6 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Electrical insulators, Electrodes, *Radio interference, *Transmission lines, Electrical coronas, Characteristics, Contamination, Electric currents, Measuring instruments, Foreign research, Performance, Electric potential, Semiconductors.
Identifiers: *Electric discharges, Great Britain, Flashover.

Radio interference (RI) from overhead lines comes from many sources; RI attributed to insulators is discussed. The RI generation is caused by: (1) corona from sharp metal parts of insulators; (2) faulty contact of the ball and socket joints between insulator units, causing small spark discharges; (3) surface discharges on dry insulators; and (4) surface discharges on wet polluted insulators. Methods of measuring RI of insulators under high-voltage stresses are considered. General principles used in designing improved insulators are given. Curves showing typical characteristics of clean insulators of several types are included, illustrating improvements that can be achieved by proper design. The effect of insulator pollution is considered. Stabilizing insulators by using a semiconducting glaze is an effective means of reducing flashover and RI level on insulators under high alternating-current stress. (USBR)

THE DETERMINATION OF EHV CLEARANCES USING PROBABILITY CONCEPTS,
Ente Nazionale per l'Energia Elettrica, Rome (Italy).
L. Paris.
Conf, Progr Overhead Lines Cables 220 kv Above, Inst Elec Eng, pp 107-113, London, Great Britain, Sept 1968. 7 p, 5 fig, 5 ref.

Descriptors: *Transmission lines, *Clearances, *Probability, *Electric insulation, *Extra high voltage, Safety, Electric potential, Conductors, Meteorological data, Winds, Temperature, Foreign research, Sagging, Ice, Errors, Costs, Transmission towers, Electric cables.
Identifiers: *Flashover, *Overvoltage, Electric discharges, Electric conductors, Italy.

Clearances between transmission line conductors and grounded parts that are typical examples of variable geometry insulation are discussed. Clearances vary as a function of conductor mobility because of temperature, wind, ice, and vehicular traffic where transmission lines cross roads. Conventional design of clearances assumes that the conductor takes on a limit configuration from which safety clearances are established. Selecting limit configurations generally assumes some degree of arbitrariness not acceptable for ehv lines because of the relationship of insulation to costs. This condition can be eliminated either by probabilistic methods or conventional methods deriving rational safety clearances and limit configurations on a probabilistic basis. The probability method for designing variable geometry insulations for transmission lines is presented. Statistics of meteorological conditions, design and erection errors, and electric loads permit eliminating arbitrariness of current methods. Applying the probabilistic method to individual insulation is painstaking, but using the method for several typical installations creates the possibility of establishing design rules that will provide desired safety levels. (USBR)

THE INFLUENCE OF SNOW AND ICE DEPOSITS ON SUPERTENSION TRANSMISSION LINE INSULATOR STRINGS WITH SPECIAL REFERENCE TO HIGH ALTITUDE OPERATION,
North-Eastern Swiss Power Co., Baden (Switzerland).
A. Meier, and W. M. Niggli.
Conf, Progr Overhead Lines Cables 220 kv Above, Inst Elec Eng, pp 386-395, London, Great Britain, Sept 1968. 10 p, 5 fig.

Descriptors: *Extra high voltage, *Electrical insulators, Ice, Snow, Field investigations, *Disturbances, *Transmission lines, Temperature, Laboratory tests, Foreign research, Storms, Electric currents, Wind velocity, Electric insulation.
Identifiers: Ice forming, Switzerland, *Icing, *Flashover, Electric discharges, Test results.

During the winter of 1966-67, short-duration disturbances by grounding occurred on a 400-kv transmission line crossing the high mountains of Switzerland. Much of this line was at elevations above 2500 m (approximately 8200 ft), the highest peak being 2750 m (approximately 9000 ft), with extremely severe atmospheric conditions at these elevations. Investigations revealed enormous snow deposits on insulators, forming a snow-ice compound that coated the insulator strings and caused heavy brush discharges. Because of poor accessibility to the line at these disturbance points, laboratory tests were conducted under simulated conditions. Tests were concerned with (1) performance of glaciated insulators, (2) the influences of temperature, and (3) voltage distribution on glaciated, multiple-insulator strings. Several suggested preventive measures tested during the winter 1967-68 showed good results. (USBR)

Identifiers: Pile-driving formulas, *Pile tests.

Four examples show how difficult constructi problems may be solved by using piles. Accordi to German norms, determining the bearing capa ty of piles by either static or dynamic equations not acceptable because the results may differ more than 100%, depending on the equation a coefficient chosen. Experimental and theoreti attempts to evaluate the contribution of point sistance and skin friction to pile bearing capac are discussed. Vertical and horizontal load capac of piles in noncohesive soils can be predicted w an adequate degree of precision by sounding or the Standard Penetration Test. If a pile foundati must be designed without this information, empi cal values given by Schenk (based on numero test loads) should be used. The bearing capacity driven pile groups in loose and medium dense san is generally greater than the sum of the beari capacities of the single piles. At very high densi the bearing capacity of a pile group is less than t sum of the bearing capacities of individual pi because the soil is not consolidated but loosened pile driving. In many cases, the decisive factor designing a pile group is not the bearing capaci but the permissible settlement. (USBR)

driving, *Pile foundations, Pile friction, *Pile
ng, Soil mechanics, Field tests, Foundations,
friction, *Settlement, Load distribution, Dif-
tial settlement, Piles (Foundations), Poisson

ifiers: *Pile caps, Pile tests.

nalysis is made of the settlement interaction
een 2 identical piles in an elastic mass; the in-
e in settlement of each pile caused by interac-
is expressed in terms of an interaction factor,
. In symmetrical pile groups where the piles
equally under equal loads the increase in set-
ent caused by interaction may be obtained by
rposition of the values of alpha for the in-
ual piles in the group. Assuming that super-
ion also holds for any general freestanding pile
p, the behavior of pile groups is analyzed for
ase of a rigid pile cap (equal settlement of all
) and a flexible pile cap (equal load in all
). The influence of pile spacing, pile length,
of group, depth of layer, and Poisson's ratio of
ayer on the settlement behavior of pile groups
amined. Comparisons are made between re-
d observations on the behavior of pile groups
model and field tests and behavior predicted
e theory. In addition to predicting the correct
ds, the theory gives quantitative values that are
easonable agreement with observed values.

THE SETTLEMENT BEHAVIOUR OF SINGLE AXIALLY LOADED INCOMPRESSIBLE PILES AND PIERS,
Sydney Univ. (Australia).
H. G. Poulos, and E. H. Davis.
Geotech, pp 351-371, Sept 1968. 21 p, 20 fig, 21 ref.

Descriptors: *Pile bearing capacities, *Pile foundations, *Settlement, *Piles (Foundations), Elastic theory, *Axial loads, Bibliographies, Pore pressure, *Stress distribution, Shear stress, Poisson ratio, Cohesive soils, Consolidation, Displacements, Soil mechanics, Foreign research.
Identifiers: Elastic foundations, Australia.

Settlement behavior of a single, axially loaded, incompressible cylindrical pile in an ideal elastic soil mass is analyzed using Mindlin's equation. By considering the pile as a number of uniformly loaded cylindrical elements together with a uniformly loaded circular base, solutions are obtained for the distribution of shear stress along the pile and the displacement of the pile. Influence factors are presented for settlement of a pile in a semi-infinite mass and in a finite layer; effects of length to diameter ratio of the pile, Poisson's ratio of the soil, and soil depth are examined. The major portion of total final settlement of a single pile in an ideal soil occurs as immediate settlement; only a small proportion occurs as time-dependent consolidation settlement. The effect of an enlarged base on the behavior of a single pile is examined and has major significance only for relatively short piles. Some approximate solutions for the settlement rate of a single pile are given. Hydraulic boundary conditions of the pile have a considerable influence on the rate of settlement at early times; the rate of pile settlement is generally slower than that of a surface footing of the same radius. (USBR)

RECENT RESULTS OF AN EXPERIMENTAL INVESTIGATION INTO SOIL PRESSURE ON RIGID WALLS,
P. I. Yakovlev, and R. V. Lubenov.
Hydrotech Constr, No 7, pp 625-629, July 1968. 5 p, 5 fig, 1 tab, 5 ref.

Descriptors: *Soil pressure, Soil engineering, Soil tests, Backfill, Retaining walls, Lateral forces, *Live loads, Pressure gages, Models, *Pressure distribution, Foreign research, Displacements, Model tests, Soil mechanics.
Identifiers: Soil stress gages, Coulomb theory, USSR.

Pressure on retaining walls is not necessarily proportional to the magnitude of variable live loads applied on the surface of the backfill. Backfill pressure was investigated in an experimental trough 109 cm high, 100 cm wide, and 177.5 cm long. Contact pressures and stresses in the backfill were measured with strain gage dynamometers. After completely removing the first uniformly distributed load from the backfill, 56.3% of the pressure increase during load application was retained. Reaction to a second and third loading was considerably different. Considering only the nature of the surface loading of the backfill during calculation and disregarding the previous loadings on the wall can produce results that do not reflect the actual stress. Pressure on the wall, measured during filling of the trough, exceeds the theoretical pressure (according to the Coulomb theory) 1.15 to 1.65 times. Backfill pressure was studied on walls that were allowed controlled displacement. As the wall displaces, pressure on the lower section decreases considerably while pressure on the upper section varies slightly. Increasing the distance of the live load from the wall reduces the lateral pressure near the backfill surface. (USBR)

CLASSIFICATION OF SOILS WITH REFERENCE TO COMPACTION,
Swedish Geotechnical Inst., Stockholm; and Aktiebolaget Vibro-Verken, Solna (Sweden).
Bengt Broms, and Lars Forssblad.
Pap, Swedish Geotech Inst, No 29, Repr Prelim Rep, Stockholm, Sweden, 1968. 10 p, 1 tab, 2 ref.

Descriptors: *Soil classifications, *Soil compaction, *Soil mechanics, Soil density, *Soil groups, Soil moisture, Soil properties, Soils, Shear strength, Soil strength, Soil types, *Compaction, Compaction equipment, Cohesive soils, Cohesionless soils, Gradation, Pneumatic tired rollers, Permeability, Rollers.
Identifiers: Soil characteristics, Vibratory compaction.

A soil classification system with 4 principal groups and subgroups divides soils into groups each requiring the same amount of compactive effect to obtain a specified degree of compaction. The 4 principal groups are: (1) rockfill and granular soils with large stones and boulders; (2) sand and gravel; (3) silt, silty, soils, clayey sand, and clayey gravel; and (4) clay. Groups 2 and 4 have subgroups. Classification in Groups 1, 2, and 3 only requires determining the gradation, but unconfined shear strength or undrained shear strength must be estimated or measured for Group 4 soils. Groups 1 and 2 are noncohesive soils with high permeability. These soils can be compacted at a high water content, have a high bearing capacity when compacted, and are not susceptible to frost action. Groups 3 and 4 are generally well-graded soils with a high content of fines. The degree of compaction depends on optimum water content to obtain maximum density. Methods and equipment that can be used to compact soils in the different groups are discussed. (USBR)

Identifiers: Concrete properties, Sulfate attack, Sonic-pulse test, Sonic velocity tests, Soniscopes, Surveys (Data collection).

The Drum Afterbay Dam, Colfax, Calif, was a concrete arch structure built in 1924. By the early 1960's, the concrete had deteriorated to a degree where arresting the destructive processes and repairing the weathered areas would be necessary within a few years. In 1965, repairs were started but suspicions immediately arose that other than normal weathering processes were responsible for some deterioration. An investigative program of concrete coring and, subsequently, sonic testing of the dam and petrographic examination of the concrete ensued. Conclusions were that the concrete was being subjected to 3 destructive processes: (1) alkali silica reactions, (2) sulfate attack, and (3) leaching of soluble substances from the cement paste matrix. These plus other findings from a concurrent stress analysis indicated that the dam had an undesirably low factor of safety. The

LIBRARY U. OF I., URBANA-CHAMPAIGN

results and the conclusion that the concrete was continuing to deteriorate at a probable high rate led to the final decision to replace the dam. (USBR)

TECHNOLOGY OF MIXING CEMENT-SAND AND SILICATE CONCRETE MIXES IN A CONTINUOUS JET MIXER,
A. R. Mashin.
Hydrotech Constr, No 8, pp 727-731, Aug 1968. 5 p, 3 fig, 4 tab.

Descriptors: *Concrete mixes, Concrete placing, Foreign construction, *Concrete plants, Concretes, *Concrete construction, Coarse aggregates, Concrete technology, Cements, *Mixers, Mixing, Mixes, *Mortar, Sands, Jets.
Identifiers: Continuous mixing, Fluidized-bed coating, Fluidized beds, Jet mixing, USSR.

A continuous jet mixing plant for stiff cement-sand and silicate mixes is described. Materials are mixed in suspension by compressed air, or compressed air and stream, forming a fluidized bed. Fluidized bed mixing intensifies water absorption by cement particles, breaks up weak particles, accelerates chemical reactions, coats sand particles with cement, permits temperature and pressure regulation, and produces high-strength uniform mixtures. The temperature and pressure control permits autoclave treatment of the mix. Jet mixing is cheaper than conventional methods. Concrete mixes are prepared in 2 stages by jet mixing cement and sand, and then mixing gravel in a forced concrete mixer. Two-stage concrete mixing reduces cement consumption by 30% and increases homogeneity of the concrete. Data and properties of sand-cement and concrete mixes are given. (USBR)

CARBON FIBRES,
W. T. Gunston.
Sci J, Vol 5, No 2, pp 39-49, Feb 1969. 11 p, 10 fig, 7 ref.

Descriptors: *Composite materials, Carbon, *Fibers, *Laminates, Costs, Laminated plastics, Materials, Materials engineering, *Plastics, Resins, Foreign research, Structural members, Manufacturing, Materials forming, Fabrication, Research and development, Chemical engineering, Materials testing.
Identifiers: Foreign products, Great Britain, *Reinforcing materials, *Carbon fibers, *Reinforced plastics.

Carbon fiber composite materials are emerging from laboratory development to commercial production, and are starting a revolution in engineering materials. Carbon fibers are stronger and stiffer than other synthetic or natural materials of the same weight, except for microscopic single crystal whiskers. Composite materials reinforced with carbon fibers can be made as stiff as steel but only one-fifth as heavy. The article reviews the development of carbon fiber production, describes manufacture of carbon fiber composite materials, and evaluates the impact on materials technology. The world's first production item using carbon fiber composite material is a Rolls-Royce turbofan engine. Present applications under investigation include automobile bodies and spacecraft. The future world market should reach the level of thousands of tons per year within the next decade, although the inevitable price advantage of glass fibers will restrict carbon fibers to true engineering structures and other hard-worked parts. SUBJECT INDEX

ION
VIATILE MORPHOGENESIS OF ROUNDNESS THE HACKING RIVER,
SOUTH WALES, AUSTRALIA,
-07755 02J

PTION
TISTS, PIGMENTS, AND PHOTOSYNTHESIS,
-07836 05A

ULATION
MULATION AND DISTRIBUTION OF MN-54 AND ZN-65 IN
SHWATER CLAMS,
-07855 05C

MINE WATER
OGRESS IN CONTROLLING ACID MINE WATER A LITERATURE
IEW,
-08059 05G

F GOD
LIAMS V STATE (FLOOD DAMAGE FROM OVERFLOWING STORM
ERS).
-07890 06E

ATED SLUDGE
OSPHATE REMOVAL BY ACTIVATED SLUDGE AT SAN ANTONIO, TEXAS,
-08048 05D

ISTRATION
ECTORY OF THE UNIVERSITY OF WISCONSIN FACULTY AND STAFF
AGED IN WATER RESOURCES ACTIVITIES.
-07824 09C

COLUMBIA RIVER TREATY, THE ECONOMICS OF AN INTERNATIONAL
ER BASIN DEVELOPMENT,
-08084 06B

EGAL-ECONOMIC ANALYSIS OF ADMINISTRATIVE AND MARKET
CEDURES USED IN THE TRANSFER OF WATER RIGHTS,
-08115 06C

ISTRATIVE AGENCIES
N OF MEREDITH V STATE BOARD OF HEALTH (STATUTORY POWERS
THE BOARD OF HEALTH TO ENFORCE REGULATIONS).
-07894 06E

TE RURAL ELECTRIFICATION AUTHORITY ACT (POWER OF
HORITY TO MAKE SURVEYS).
-07898 06E

OR BOATS, REGISTRATION, EQUIPMENT AND OPERATION.
-07901 06E

IMAGE.
-07902 06E

ARTMENT OF CHESAPEAKE BAY AFFAIRS.
-07907 06E

TE SHELL-FISHERIES.
-07917 06E

-07919 06E

E ASPECTS OF PUBLIC ORGANIZATION FOR WATER MANAGEMENT,
-08103 06E

PTION
OSPHATE REMOVAL BY ACTIVATED SLUDGE AT SAN ANTONIO, TEXAS,
-08048 05D

ICED WASTE TREATMENT
GALLOPING GHOST OF EUTROPHY,
-07818 05C

ION
IMIZATION OF A CLASS OF RIVER AERATION PROBLEMS BY THE
OF MULTIVARIABLE DISTRIBUTED PARAMETER CONTROL THEORY,
-08061 05G

IC TREATMENT
E GAS COMPOSITION UNDER SEWAGE SPREADING,
-08027 05B

ETIC DETERIORATION
GALLOPING GHOST OF EUTROPHY,
-07818 05C

CULTURE
STES IN RELATION TO AGRICULTURE AND FORESTRY,
-08029 05C

AE AND MAN.
-07832 05C

AL PROBLEMS RELATED TO THE EUTROPHICATION OF EUROPEAN
ER SUPPLIES, AND A BIO-ASSAY METHOD TO ASSESS FERTILIZING
FLUENCES OF POLLUTION ON INLAND WATERS,
-07833 05C

FECTS OF TEMPERATURE ON THE SORPTION OF RADIONUCLIDES BY A
F-GREEN ALGA,
-07845 05C

CATIVE NORMS
ETON AND WELDON ON PUBLIC GOODS,
W69-08085 06B

ALLOTMENTS
WINDFALL GAINS FROM TRANSFER OF WATER ALLOTMENTS WITHIN THE COLORADO-BIG THOMPSON PROJECT,
W69-08111 06E

ALLUVIAL CHANNELS
FORMATION OF FLOOD PLAIN LANDS,
W69-07707 04A

CHANGES IN THE CHANNEL MORPHOLOGY OF TRINITY RIVER AND EIGHT TRIBUTARIES IN CALIFORNIA, 1961-65,
W69-07747 02E

SEDIMENT TRANSPORTATION IN RIVER CHANNELS WITH FLOOD PLAINS,
W69-07760 02J

SEDIMENT TRANSPORTATION AND THE MEANS OF ITS ESTIMATION,
W69-07763 02J

CHANNEL CAPACITY AND THE ADJUSTMENT OF STREAMS TO HYDROLOGIC REGIME,
W69-08006 02E

ALLUVIATION
GROUNDWATER AQUIFER PATTERNS AND VALLEY ALLUVIATION ALONG MOUNTAIN FORK CREEK, CRAWFORD COUNTY, ARKANSAS,
W69-08118 02F

ALPINE
RESEARCH ON GLACIER ACTIVITY (GERMAN),
W69-07968 02C

ALPS(EASTERN)
RESEARCH ON GLACIER ACTIVITY (GERMAN),
W69-07968 02C

ALTERNATIVE ACTIONS
FRAMEWORKS OF DECISION MAKING,
W69-08101 06B

ALTERNATIVE GOALS
COMPREHENSIVE, MULTIPLE PURPOSE WATER RESOURCES DEVELOPMENT,
W69-08104 06B

ALTERNATIVE OBJECTIVES
THE ECONOMICS OF WATER RESOURCES INVESTMENT,
W69-08105 06B

ALTERNATIVE USES
THE VALUE OF WATER IN ALTERNATIVE USES WITH SPECIAL APPLICATION TO WATER USE IN THE SAN JUAN AND RIO GRANDE BASINS OF NEW MEXICO.
W69-08087 06B

AMESVILLE(OHIO)
FLOODS AT AMESVILLE, OHIO,
W69-07735 07C

AMMONIA
NITROGEN LOSSES FROM ALKALINE WATER IMPOUNDMENTS,
W69-08011 05D

ANALOG COMPUTER SIMULATION
USE OF ANALOG COMPUTERS FOR SIMULATING THE MOVEMENT OF ISOTOPES IN ECOLOGICAL SYSTEMS,
W69-07819 05B

ANALOG COMPUTERS
SIMULTANEOUS USE OF AN ANALOG SINGLE-PURPOSE ELECTRONIC COMPUTER AND A PHYSICAL MODEL OF A WATERSHED,
W69-07743 02A

USE OF ANALOG COMPUTERS FOR SIMULATING THE MOVEMENT OF ISOTOPES IN ECOLOGICAL SYSTEMS,
W69-07819 05B

APPLICATION OF AN ELECTRONIC ANALOG COMPUTER TO THE EVALUATION ON THE EFFECTS OF URBANIZATION OF THE RUNOFF CHARACTERISTICS OF SMALL WATERSHEDS,
W69-07951 04C

SPECIALIZED ANALOG COMPUTERS FOR HYDROLOGICAL CALCULATIONS AND FORECASTS,
W69-07952 07C

THE SOLUTION OF DIRECT AND INVERSE PROBLEMS OF OUTLET WAVES SPREADING ON ANALOG COMPUTERS,
W69-07953 07C

THE MAR ANALOG COMPUTER FOR MODELLING HYDROLOGICAL SERIES BY THE MONTE CARLO METHOD,
W69-07954 02A

ESTIMATION OF FLOODS WITH THE AID OF ANALOGUE COMPUTERS,
W69-07955 02E

UTILIZATION OF THE ANALOG COMPUTER FOR SIMULATING THE SALINITY FLOW SYSTEM OF THE UPPER COLORADO RIVER BASIN,
W69-07957 02E

ANALOG MODELS
SIMULTANEOUS USE OF AN ANALOG SINGLE-PURPOSE ELECTRONIC COMPUTER AND A PHYSICAL MODEL OF A WATERSHED,
W69-07743 02A

LIBRARY U. OF I., URBANA-CHAMPAIGN

WATERSHED SIMULATION BY ELECTRONIC ANALOG COMPUTER,
W69-07744 02A

APPLICATION OF AN ELECTRONIC ANALOG COMPUTER TO A STUDY OF WATER RESOURCES MANAGEMENT,
W69-07745 06D

APPLICATION OF ANALOGUE COMPUTERS FOR PREDICTING THE GROUND WATER REGIME OF ARTESIAN BASINS UNDER CONDITIONS OF THEIR DEVELOPMENT,
W69-07746 02F

USE OF ANALOG COMPUTERS FOR SIMULATING THE MOVEMENT OF ISOTOPES IN ECOLOGICAL SYSTEMS,
W69-07819 05B

ELECTROLYTIC TANK TYPE MODELS FOR PREDICTING THE POSITION OF THE GROUNDWATER TABLE AND THE LOSS OF RIVER DISCHARGES,
W69-07949 02A

ELECTRICAL-ANALOG ANALYSIS OF THE HYDROLOGIC SYSTEM IN TUCSON BASIN, ARIZONA, U.S.A.,
W69-07950 02F

APPLICATION OF AN ELECTRONIC ANALOG COMPUTER TO THE EVALUATION ON THE EFFECTS OF URBANIZATION OF THE RUNOFF CHARACTERISTICS OF SMALL WATERSHEDS,
W69-07951 04C

NEW APPROACH SUGGESTED FOR DESIGN OF ELECTRICAL ANALOG COMPUTERS FOR GROUNDWATER FLOW STUDIES,
W69-07956 02F

APPLICATION OF THE HYDRAULIC ANALOGY TO FIELD AMPLIFIER DESIGN (FRENCH),
W69-08020 02A

ANALYTICAL TECHNIQUES
EVALUATION OF THE PYRIDINE-ALKALI COLORIMETRIC METHOD FOR DETERMINATION OF ATRAZINE,
W69-07821 05A

FUNCTION SPACE APPROACH TO PARAMETER IDENTIFICATION IN DISTRIBUTED SYSTEMS,
W69-08023 02A

ANTARCTIC
GLACIER MOVEMENT IN THE MIRNYY AREA (RUSSIAN),
W69-07751 02C

MICROBIOLOGICAL RESEARCH OF THE GLUBOKOYE LAKE NEAR THE MOLODEZHNAYA STATION (RUSSIAN),
W69-07752 02H

STRUCTURE, BASIC PROPERTIES, AND STRENGTH OF MARINE ANTARCTIC ICE (RUSSIAN),
W69-07767 02C

ANTI-POLLUTION AGENT
PROMISING ANTI-POLLUTANT CHELATING AGENT NTA PROTECTS FISH FROM COPPER AND ZINC,
W69-07817 05C

AQUATIC ENVIRONMENTS
ACCUMULATION OF RADIUM-226 IN TWO AQUATIC ECOSYSTEMS,
W69-07846 05C

AQUATIC MICROBIOLOGY
RESEARCH IN AQUATIC MICROBIOLOGY TRENDS AND NEEDS,
W69-07843 05C

AQUATIC PLANTS
THE INFLUENCE OF AQUATIC VEGETATION ON RIVER DISCHARGE,
W69-07989 04A

AQUATIC WEED CONTROL
MECHANICAL HARVESTING OF LAKE WEEDS APPEARS PROMISING FOR HALTING AGING PROCESS,
W69-07815 02H

AQUIFER
GROUNDWATER AQUIFER PATTERNS AND VALLEY ALLUVIATION ALONG MOUNTAIN FORK CREEK, CRAWFORD COUNTY, ARKANSAS,
W69-08118 02F

AQUIFERS
FORECASTING THE RISE OF GROUNDWATERS IN THE AREA OF THE RIVER VAKHSH FOURTH TERRACE (RUSSIAN),
W69-07750 02F

NEW APPROACH SUGGESTED FOR DESIGN OF ELECTRICAL ANALOG COMPUTERS FOR GROUNDWATER FLOW STUDIES,
W69-07956 02F

MINERAL WATERS OF THE BURGAS (BULGARIA) ARTESIAN BASIN AND THEIR HEALTH RESORT AND ECONOMIC SIGNIFICANCE (BULGARIAN),
W69-07970 02F

HARDNESS OF GROUND WATERS IN BULGARIA (BULGARIAN),
W69-07971 02F

DETERMINATION OF HYDROGEOLOGICAL PARAMETERS BY PUMPING TESTS IN WATER TABLE AQUIFER (BULGARIAN),
W69-07972 02F

CARBONATE EQUILIBRIA AND RADIOCARBON DISTRIBUTION RELATED TO GROUNDWATER FLOW IN THE FLORIDAN LIMESTONE AQUIFER, USA,
W69-07985 02F

UNCONFINED AQUIFERS AND THE CONCEPT OF THE SPECIFIC YIELD,
W69-08000 02F

THE APPLICATION OF ENGINEERING GEOLOGY IN THE REGIONAL DEVELOPMENT OF NORTHERN AND CENTRAL IRAN,
W69-08009 4B

EFFECT OF NEOTECTONICS ON THE FORMATION CONDITIONS OF GRO WATERS OF THE EASTERN PART OF THE CHU BASIN (RUSSIAN),
W69-08016 02F

ARCH DAMS
INVESTIGATION OF DETERIORATED CONCRETE ARCH DAM,
W69-07785 08F

ARCTIC
SEDIMENTATION IN AN ARCTIC LAKE,
W69-07947 02J

ARIZONA
HYDROLOGIC CONDITIONS IN THE GILA BEND BASIN, MARICOPA COUNTY, ARIZONA,
W69-07712 03F

WATER AND CHOICE IN THE COLORADO BASIN,
W69-07925 06D

ELECTRICAL-ANALOG ANALYSIS OF THE HYDROLOGIC SYSTEM IN TUCSON BASIN, ARIZONA, U.S.A.,
W69-07950 02F

WATER REQUIREMENTS AND USES IN ARIZONA MINERAL INDUSTRIES
W69-08058 03E

ARKANSAS
FLOOD PLAIN INFORMATION OF ARKANSAS RIVER AND TRIBUTARIES RUSSELLVILLE AND DARDANELLE, ARKANSAS.
W69-07715 04A

ARTESIAN WELLS
MINERAL WATERS OF THE BURGAS (BULGARIA) ARTESIAN BASIN AN THEIR HEALTH RESORT AND ECONOMIC SIGNIFICANCE (BULGARIAN)
W69-07970 02F

ASSESSMENTS
DEVELOPMENT OF DRAINAGE ASSESSMENT PROCEDURES BASED ON PHYSICAL FEATURES IN ILLINOIS,
W69-08124 04A

ASSET-PREFERENCE APPROACH
INVESTMENT DECISION UNDER UNCERTAINTY CHOICE-THEORETIC APPROACHES,
W69-08095 06C

ATOMIC ENERGY
RESOURCES DEVELOPMENT FRONTIERS FOR RESEARCH.
W69-08088 06B

ATRAZINE
EVALUATION OF THE PYRIDINE-ALKALI COLORIMETRIC METHOD FOR DETERMINATION OF ATRAZINE,
W69-07821 05A

ATTITUDES
THE CHANGING VIEWPOINTS OF WATER RESOURCES PLANNING,
W69-07783 06B

THE PERCEPTION OF NATURAL HAZARDS IN RESOURCE MANAGEMENT,
W69-08099 06B

AUSTIN(TEX)
APPLICATION OF AN ELECTRONIC ANALOG COMPUTER TO THE EVALUATION ON THE EFFECTS OF URBANIZATION OF THE RUNOFF CHARACTERISTICS OF SMALL WATERSHEDS,
W69-07951 04C

AUTOMATIC CONTROL
DIGITAL COMPUTERS FOR HYDROELECTRIC POWER STATIONS,
W69-07803 08C

AXIAL LOADS
THE SETTLEMENT BEHAVIOUR OF SINGLE AXIALLY LOADED INCOMPRESSIBLE PILES AND PIERS,
W69-07808 08D

BACILLUS COLI
THE PHYSIOLOGY OF THE COLIFORM GROUP,
W69-07835 05A

BACTERIA
THE BACTERIOLOGY OF INTERFACES,
W69-07834 05C

THE PHYSIOLOGY OF THE COLIFORM GROUP,
W69-07835 05A

THE METHANE FERMENTATION,
W69-07837 05A

SOME ASPECTS OF THE BACTERIOLOGY OF THE RUMEN,
W69-07839 05A

PHYSIOLOGY OF THE RUMEN PROTOZOA,
W69-07840 05A

PROTEOLYSIS AND PROTEOLYTIC ORGANISMS,
W69-07842 05D

BASIN AND RANGE PROVINCE
TREND-SURFACE ANALYSIS OF THE BASIN AND RANGE PROVINCE, A SOME GEOMORPHIC IMPLICATIONS,
W69-07730 04A

THAL OXYGEN CONCENTRATIONS FOR TROUT AND SMALLMOUTH BASS,
9-07864 05C

RES
EDGING AND BEACHES.
9-07904 06E

ASTAL WATERS AND THE NATION,
9-07923 06B

LOAD
E EFFECT OF WATER DETENTION STRUCTURES ON RIVER AND DELTA
RPHOLOGY,
9-07761 02J

E RESULTS OF CONTINUOUS BED LOAD MEASUREMENTS RELATED TO
UCTUATIONS OF THE RIVER BED,
9-07762 02J

ANSPORT VELOCITIES OF SINGLE PARTICLES IN BED-LOAD MOTION,
9-07769 02J

CRITICAL REVIEW OF CONVENTIONAL BED LOAD FORMULAE,
9-08003 02J

VIOR
E REACTIONS OF FISH TO WATER OF LOW OXYGEN CONCENTRATION,
9-07830 05C

FITS
E COLUMBIA RIVER TREATY, THE ECONOMICS OF AN INTERNATIONAL
VER BASIN DEVELOPMENT,
9-08084 06B

VELOPMENT OF DRAINAGE ASSESSMENT PROCEDURES BASED ON
YSICAL FEATURES IN ILLINOIS,
9-08124 04A

PACT OF COMMUNITY WATER SYSTEMS IN SMALL TOWNS,
9-08125 06B

IOGRAPHIES
VANCES IN HYDROSCIENCE.
9-07723 02A

INCIPAL LAKES OF THE UNITED STATES,
9-07770 07C

LICATE REACTIONS--A REVIEW,
9-08022 02K

SSAY
GAL PROBLEMS RELATED TO THE EUTROPHICATION OF EUROPEAN
TER SUPPLIES, AND A BIO-ASSAY METHOD TO ASSESS FERTILIZING
FLUENCES OF POLLUTION ON INLAND WATERS,
9-07833 05C

HEMISTRY
E METHANE FERMENTATION,
9-07837 05A

EGRADATION
DESIGN PROCEDURE FOR BIOLOGICAL NITRIFICATION AND
NITRIFICATION,
9-08054 05D

IALYSTAT
ODIALYSTAT NEW SAMPLER FOR DISSOLVED ORGANIC MATTER,
9-07865 05A

ASS
E CONCEPTUAL FORMULATION AND MATHEMATICAL SOLUTION OF
ACTICAL PROBLEMS IN POPULATION INPUT-OUTPUT DYNAMICS,
9-07816 06G

A
FECT OF HANFORD REACTOR SHUTDOWN ON COLUMBIA RIVER BIOTA,
9-07853 05C

D
DIOSTRONTIUM UPTAKE IN BLOOD AND FLESH IN BLUEGILLS
EPOMIS MACROCHIRUS),
9-07852 05C

TING REGULATION
TOR BOATS, REGISTRATION, EQUIPMENT AND OPERATION.
9-07901 06E

TING REGULATIONS
INE BUREAU OF WATERCRAFT REGISTRATION AND SAFETY
COMPREHENSIVE STATUTE REGULATING USE OF POWERED
TORCRAFT).
9-07900 06E

TS
INE BUREAU OF WATERCRAFT REGISTRATION AND SAFETY
COMPREHENSIVE STATUTE REGULATING USE OF POWERED
TORCRAFT).
9-07900 06E

TOR BOATS, REGISTRATION, EQUIPMENT AND OPERATION.
9-07901 06E

IES OF WATER
MS AND LAKE WATER LEVELS.
9-07883 06E

EHOLES
ATURAL STORAGE TANKS USED TO REFILL THE THAMES RIVER,
9-07701 04B

BRIDGE CONSTRUCTION
ROADS AND HIGHWAYS.
W69-07889 06E

W69-07890 06E

W69-07891 06E

W69-07892 06E

BRIDGE CORPORATIONS
ROADS AND HIGHWAYS.
W69-07889 06E

BRIDGES
ROADS AND HIGHWAYS.
W69-07889 06E

W69-07890 06E

W69-07891 06E

BULGARIA
MINERAL WATERS OF THE BURGAS (BULGARIA) ARTESIAN BASIN AND
THEIR HEALTH RESORT AND ECONOMIC SIGNIFICANCE (BULGARI),
W69-07970 02F

HARDNESS OF GROUND WATERS IN BULGARIA (BULGARIAN),
W69-07971 02F

HYDROLOGIC REGIONS IN BULGARIA (BULGARIAN),
W69-07979 02E

CALCIUM
STRONTIUM-CALCIUM RELATIONSHIPS IN AQUATIC FOOD CHAINS.
W69-07850 05C

CALIFORNIA
FLOOD PLAIN INFORMATION OF SWEETWATER RIVER, SAN DIEGO
COUNTY, CALIFORNIA.
W69-07716 04A

CHANGES IN THE CHANNEL MORPHOLOGY OF TRINITY RIVER AND EIGHT
TRIBUTARIES IN CALIFORNIA, 1961-65,
W69-07747 02E

DOWNSTREAM CHANGES IN SEDIMENTOLOGICAL PARAMETERS
ILLUSTRATED BY PARTICLE DISTRIBUTION FROM A BREACHED
ROCKFILL DAM,
W69-07754 02J

CHLORINATED HYDROCARBON PESTICIDES IN CALIFORNIA BAYS AND
ESTUARIES,
W69-07920 05B

WASTEWATER RECLAMATION AND EXPORT AT SOUTH TAHOE,
W69-07922 05D

A SYSTEMS ENGINEERING APPROACH TO WATER QUALITY MANAGEMENT,
W69-07924 05G

HYDROLOGIC DATA 1967, VOLUME 5 SOUTHERN CALIFORNIA,
W69-07933 02E

HANDBOOK OF FEDERAL AND STATE PROGRAMS OF FINANCIAL
ASSISTANCE FOR WATER DEVELOPMENT.
W69-07974 09D

CAPITAL INVESTMENT
MARKET STRUCTURE AND THE STABILITY OF INVESTMENT,
W69-08064 06C

CARBON CYCLE
USE OF ANALOG COMPUTERS FOR SIMULATING THE MOVEMENT OF
ISOTOPES IN ECOLOGICAL SYSTEMS,
W69-07819 05B

CARBON FIBERS
CARBON FIBRES,
W69-07779 08G

CARBONATES
CARBONATE TURBIDITES, GULF OF MEXICO,
W69-07945 02J

CASPIAN SEA
THE EFFECT OF CASPIAN SEA LEVEL OSCILLATIONS ON EVAPORATION
INTENSITY FROM ITS SURFACE (RUSSIAN),
W69-08030 02D

CENTRAL ARIZONA PROJECT
WATER AND CHOICE IN THE COLORADO BASIN,
W69-07925 06D

CESIUM
INTERACTING EFFECTS OF GAMMA RADIATION AND SODIUM HALIDE
CONCENTRATIONS ON RAINBOW TROUT,
W69-07849 05C

CESIUM, CESIUM-137, AND POTASSIUM CONCENTRATIONS IN WHITE
CRAPPIE AND OTHER CLINCH RIVER FISH,
W69-07854 05C

CESIUM-137 IN SOME COLORADO GAME FISH, 1965-66,
W69-07857 05C

CESIUM-137 IN FRESHWATER FISH DURING 1954-1965,
W69-07860 05C

CHANNEL FLOW

LIBRARY U. OF I., URBANA-CHAMPAIGN

FLUVIATILE OBSTACLE MARKS FROM THE WADIS OF THE NEGEV (SOUTHERN ISRAEL),
W69-07944 02J

CHANNEL MORPHOLOGY
CHANGES IN THE CHANNEL MORPHOLOGY OF TRINITY RIVER AND EIGHT TRIBUTARIES IN CALIFORNIA, 1961-65,
W69-07747 02E

THE EFFECT OF WATER DETENTION STRUCTURES ON RIVER AND DELTA MORPHOLOGY,
W69-07761 02J

SPATIAL VARIATION OF FLOOD FREQUENCIES AS RELATED TO HYDRAULIC GEOMETRY,
W69-07991 02E

CHANNEL CAPACITY AND THE ADJUSTMENT OF STREAMS TO HYDROLOGIC REGIME,
W69-08006 02E

CHELATION
PROMISING ANTI-POLLUTANT CHELATING AGENT NTA PROTECTS FISH FROM COPPER AND ZINC,
W69-07817 05C

CHEMICAL ANALYSIS
NUCLEAR METHODS IN AIR AND WATER POLLUTION ANALYSIS,
W69-07782 05A

EVALUATION OF THE PYRIDINE-ALKALI COLORIMETRIC METHOD FOR DETERMINATION OF ATRAZINE,
W69-07821 05A

CHEMICAL REACTIONS
RESEARCH IN AQUATIC MICROBIOLOGY TRENDS AND NEEDS,
W69-07843 05C

CARBONATE EQUILIBRIA AND RADIOCARBON DISTRIBUTION RELATED TO GROUNDWATER FLOW IN THE FLORIDAN LIMESTONE AQUIFER, USA,
W69-07985 02F

SILICATE REACTIONS--A REVIEW,
W69-08022 02K

CHLOROPHYLL
PROTISTS, PIGMENTS, AND PHOTOSYNTHESIS,
W69-07836 05A

CHOICE-THEORETIC SYSTEM
INVESTMENT DECISION UNDER UNCERTAINTY CHOICE-THEORETIC APPROACHES,
W69-08095 06C

CHU BASIN(CENT
EFFECT OF NEOTECTONICS ON THE FORMATION CONDITIONS OF GROUND WATERS OF THE EASTERN PART OF THE CHU BASIN (RUSSIAN),
W69-08016 02F

CIVIC PLANNING
THE ROLE OF WATER IN CIVIC PLANNING,
W69-08083 06B

CLAMS
ACCUMULATION AND DISTRIBUTION OF MN-54 AND ZN-65 IN FRESHWATER CLAMS,
W69-07855 05C

RADIOACTIVE AND STABLE STRONTIUM ANALYSIS OF UPPER MISSISSIPPI RIVER CLAMSHELLS,
W69-07858 05C

CLAY LOAM
HYDRAULIC PROPERTIES OF A CLAY LOAM SOIL AND THE FIELD MEASUREMENT OF WATER UPTAKE BY ROOTS 1. INTERPRETATION OF WATER CONTENT AND PRESSURE PROFILES,
W69-07966 02G

CLAYS
SELF-DIFFUSION OF TRITIATED WATER IN MONTMORILLONITE AND KAOLINITE CLAY,
W69-07965 02G

CLEARANCES
THE DETERMINATION OF EHV CLEARANCES USING PROBABILITY CONCEPTS,
W69-07806 08C

CLIMATES
RESEARCH ON GLACIER ACTIVITY (GERMAN),
W69-07968 02C

CLIMATIC ZONES
HYDROLOGIC REGIONS IN BULGARIA (BULGARIAN),
W69-07979 02E

CLINCH RIVER(TENN)
CESIUM, CESIUM-137, AND POTASSIUM CONCENTRATIONS IN WHITE CRAPPIE AND OTHER CLINCH RIVER FISH,
W69-07854 05C

COAL MINES
COMPLIANCE WITH ARTICLE SUSPENDED WHERE REQUIRED EQUIPMENT UNOBTAINABLE ALLOWANCE FOR PLANNING AND INSTITUTING CHANGES.
W69-07879 06E

COASTAL FLOODING
THE HUMAN ECOLOGY OF COASTAL FLOOD HAZARD IN MEGALOPOLIS,
W69-07942 06G

COASTAL MARSHES
COASTAL WATERS AND THE NATION,
W69-07923 06B

COASTS
THE HUMAN ECOLOGY OF COASTAL FLOOD HAZARD IN MEGALOPOLIS
W69-07942 06G

COLIFORMS
THE PHYSIOLOGY OF THE COLIFORM GROUP,
W69-07835 05A

COLORADO
FLOOD PLAIN INFORMATION-GOODNIGHT ARROYO, DRY CREEK AND HORSE-DRY CREEK, PUEBLO, COLORADO.
W69-07708 04A

CESIUM-137 IN SOME COLORADO GAME FISH, 1965-66,
W69-07857 05C

COLORADO RIVER
UTILIZATION OF THE ANALOG COMPUTER FOR SIMULATING THE SALINITY FLOW SYSTEM OF THE UPPER COLORADO RIVER BASIN,
W69-07957 02E

COLORADO RIVER BASIN
WATER AND CHOICE IN THE COLORADO BASIN,
W69-07925 06D

COLORIMETRY
EVALUATION OF THE PYRIDINE-ALKALI COLORIMETRIC METHOD F DETERMINATION OF ATRAZINE,
W69-07821 05A

COLUMBIA RIVER
SEDIMENT RADIOACTIVITY IN THE COLUMBIA RIVER ESTUARY,
W69-07851 05C

EFFECT OF HANFORD REACTOR SHUTDOWN ON COLUMBIA RIVER BI
W69-07853 05C

COLUMBIA RIVER BASIN
THE COLUMBIA RIVER TREATY, THE ECONOMICS OF AN INTERNAT RIVER BASIN DEVELOPMENT,
W69-08084 06B

COLUMBIA RIVER TREATY
THE COLUMBIA RIVER TREATY, THE ECONOMICS OF AN INTERNAT RIVER BASIN DEVELOPMENT,
W69-08084 06B

COMMERCIAL FISHING
TIDAL WATERS.
W69-07887 06F

ON MODELS OF COMMERCIAL FISHING,
W69-08098 06C

COMMERCIAL SHELLFISH
STATE SHELL-FISHERIES.
W69-07917 06E

W69-07918 06E

W69-07919 06E

COMPACTION
CLASSIFICATION OF SOILS WITH REFERENCE TO COMPACTION,
W69-07813 08D

COMPOSITE MATERIALS
CARBON FIBRES,
W69-07779 08G

COMPUTER MODELS
DIGITAL COMPUTER SOLUTIONS FOR FLOOD HYDROGRAPH PREDICT FROM RAINFALL DATA,
W69-07958 02A

DETERMINATION OF THE RUNOFF HYDROGRAPH ON A DETERMINIST BASIS USING A DIGITAL COMPUTER,
W69-07959 02A

COMPUTER PROGRAMS
SOLUBILITY OF GYPSUM IN AQUEOUS ELECTROLYTES AS AFFECTE ION ASSOCIATION AND IONIC STRENGTHS UP TO 0.15M AND AT DEG C,
W69-07700 02K

FUNCTION SPACE APPROACH TO PARAMETER IDENTIFICATION IN DISTRIBUTED SYSTEMS,
W69-08023 02A

CONCENTRATION
CONCENTRATION OF SODIUM BY FRESH WATER TURTLES,
W69-07856 05C

CONCENTRATIONS
CESIUM, CESIUM-137, AND POTASSIUM CONCENTRATIONS IN WHI CRAPPIE AND OTHER CLINCH RIVER FISH,
W69-07854 05C

CONCRETE CONSTRUCTION
TECHNOLOGY OF MIXING CEMENT-SAND AND SILICATE CONCRETE IN A CONTINUOUS JET MIXER,
W69-07810 08F

CONCRETE DAMS
INVESTIGATION OF DETERIORATED CONCRETE ARCH DAM,
W69-07785 08F

CRETE MIXES
ECHNOLOGY OF MIXING CEMENT-SAND AND SILICATE CONCRETE MIXES
N A CONTINUOUS JET MIXER,
69-07810 08F

CRETE PIPES
ACTORS OF SAFETY IN THE DESIGN OF BURIED PIPELINES,
69-07792 08A

CRETE PLANTS
ECHNOLOGY OF MIXING CEMENT-SAND AND SILICATE CONCRETE MIXES
N A CONTINUOUS JET MIXER,
69-07810 08F

CRETE TECHNOLOGY
NVESTIGATION OF DETERIORATED CONCRETE ARCH DAM,
69-07785 08F

DEMNATION
FASEHOLD INTERESTS IN EMINENT DOMAIN,
69-07814 06E

ROBART V PASSAIC VALLEY WATER COMM'N (CONDEMNATION OF WATER
IGHTS).
69-07899 06E

DUCTORS
HV PIPE-TYPE CABLE INSULATED WITH SF6 GAS,
69-07804 08C

FERENCES
ADIOECOLOGY.
69-07863 05C

INERAL RESOURCES OF THE WORLD OCEAN.
69-07973 06B

FINEMENT PENS
NIMAL WASTES--A NATIONAL PROBLEM,
69-08010 05B

FLICTS
ESTERN WATER LAW AND CONFLICTS BETWEEN THE STATES AND THE
EDERAL GOVERNMENT,
69-08090 06E

NECTICUT
TATE SHELL-FISHERIES.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 2, NUMBER 20
OCTOBER 15, 1969

LIBRARY U. OF I., URBANA-CHAMPAIGN

W69-08127 -- W69-08628

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

CLEARINGHOUSE

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

DOWNGRADED AT 3 YEAR INTERVALS
DECLASSIFIED AFTER 12 YEARS

VOLUME 2, NUMBER 20
OCTOBER 15, 1969

W69-08127 -- W69-08628

f funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

LIBRARY U. OF A. URBANA-CHAMPAIGN

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I., URBANA-CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

exchange of heat across the air-water interface e of the more important factors that govern the perature of a water body. The net rate of heat ange at the water surface is the sum of the s at which heat is transferred by radiative esses, by evaporation, and by conduction reen water and overlying air. The net rate can valuated in terms of a thermal exchange coeffi- t and an equilibrium temperature, both of ch depend on observable meteorological varia- Any one of the many evaporation formulas mathematical descriptions of the other heat ange processes may be used to develop equa- s involving the thermal exchange coefficient equilibrium temperature. Such equations are ul in developing relations that describe the poral and spatial temperature distributions in a water body. They provide additional in- t into the effects of meteorological conditions water temperatures, and they facilitate esti- es of various terms of the heat budget. (Motz-derbilt)

ON A METHOD OF FLOOD FORECASTING USING A DIGITAL COMPUTER CONNECTED WITH A WEATHER RADAR,
National Research Center for Disaster Prevention, Tokyo (Japan).
Masami Sugawara.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 161-169, 1968. 9 p, 8 fig.

Descriptors: *Weather data, *Analog computers, *Digital computers, *Flood forecasting, Rainfall-runoff relationships, Radar, Remote sensing, Telemetry.
Identifiers: *Japan, *Hybrid computers.

Experiments were carried out in Japan using weather radar information, converted from analog to digital form, in a digital computer to forecast floods. The rainfall data were calibrated by comparison with rain gage data. Data were recorded on video tape for transportation from the radar installation to the computer. Because radar echoes are very high-frequency phenomena and floods are very low-frequency phenomena, information density at the radar site is reduced using the simplest analog method possible, and the resulting low-frequency data are presented on a polar coordinate mesh. (Knapp-USGS)
W69-08229

A COMPARATIVE ANALYSIS OF DIGITAL AND ANALOG COMPUTERS AS TO THEIR EFFECTIVENESS IN SOLVING RUNOFF ANALYSIS,
National Research Center for Disaster Prevention, Tokyo (Japan).
M. Sugawara.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 170-174, 1968. 5 p, 4 fig, 2 ref.

Descriptors: *Rainfall-runoff relationships, *Computer models, *Analog computers, *Digital computers, Telemetry, Radar, Snowmelt, Runoff forecasting, Streamflow forecasting, Computers, Rainfall, Runoff, Forecasting.
Identifiers: *Japan, *Hybrid computers.

In Japan, digital rather than analog computers are used to analyze rainfall-runoff relationships. Analog computers are less flexible for many purposes than digital computers. For example, in calculating the effect of snow deposit and snow melt, or the effect of irrigation to paddy fields, analog computers are not effective. As hydrological data are mainly given in digital form, because of their low frequency, digital computers are convenient because of their digital input and output. To use analog computers with digital imput, systems which somewhat resemble hybrid computers may be constructed. Analog computers are effective for their proper purposes, so combining them with digital computers can result in powerful systems. An example is the connection of a digital computer with a weather radar. In this case, the analog system is set at the radar site as the preparatory system for a digital computer. (Knapp-USGS)

Descriptors: *River forecasting, *Digital computers, *Data processing, *California, Rainfall-runoff relationships, Antecedent precipitation, Snowpacks, Snowmelt, Rainfalls, Winds, Temperature, Runoff, Hydrographs, Synthetic hydrology, Runoff forecasting.
Identifiers: Northern California rivers.

The north coast of California is generally composed of mountainous basins ranging in altitude from sea level to elevations in excess of 6000 feet. Stream data sampling is concentrated in the lower elevations. Historical storms have produced runoff volumes in excess of 30 inches. Precipitation occurs primarily in the winter months, generally as snow in the upper elevations. A computerized technique is described which provides a timely discharge forecast. Precipitation includes an approximation of wind influences during the storm period and is determined for all basins from limited wind, temperature and precipitation data. Surface runoff is computed from antecedent rainfall, a seasonal parameter and effective basin rainfall. The outflow hydrographs for 15 basins are synthesized from surface and subsurface flow computations. (Knapp-USGS)

WATERSHED MODELING APPROACH TO EVALUATION OF THE HYDROLOGIC POTENTIAL OF UNIT AREAS,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Henry W. Anderson.
International Symposium on Forest Hydrology, Proc (1965): 735-746. Pergamon Press - Oxford and New York - 1966.

Descriptors: *Hydrologic properties, *Environmental effects, *Analytical methods, *Statistical models, *Regression analysis, Watershed management, Snow cover, Snowmelt, Snow management, Sediment discharge, Mountains, Large watersheds, California, Mathematical models, Mathematical studies.
Identifiers: Principal components analysis, Factor analysis, Logging (Timber).

The hydrologic potential of forest sites can be interpreted from analyses of watershed models and models of hydrologic processes. This concept is illustrated by a model relating sediment discharge from forty-six watersheds in northern California to watershed variables, and by a model relating snow accumulation at 163 snow courses to variables of terrain, including forest variables. Factor analysis is used in testing the adequacy of sampling of independent variables; principal component regression analyses are used in establishing physical relations to sediment and snow. Factor contributions after varimax rotation allows improved interpretation of explained variance. Application of a model in evaluating flood sources and the sediment potential of unit areas is illustrated.

SOURCE AREAS OF STORM RUNOFF,
Tennessee Valley Authority, Knoxville.
Roger P. Betson, and John B. Marius.
Water Resources Res, Vol 5, No 3, p 574-582, June 1969. 9 p, 5 fig, 1 tab, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Runoff, *Storm runoff, Routing, Antecedent precipitation, Soils, Piezometers, Rain gages, Permeability, Infiltration, Runoff forecasting.
Identifiers: Runoff source areas.

An investigation of runoff from a 4.64-acre agricultural watershed included the use of subplots, observation wells, and piezometers to determine the extent of source areas of storm runoff within the catchment. Studies of data collected showed that most of the storm runoff usually originates from a small portion of the total drainage area and that the location and extent of the source area is dependent upon rainfall intensity, antecedent moisture, and the depth of the A horizon soil. OPTIMAL IDENTIFICATION OF LUMPED WATERSHED MODELS,
California Univ., Los Angeles.
John W. Labadie, and John A. Dracup.
Water Resources Res, Vol 5, No 3, p 583-590, June 1969. 8 p, 3 fig, 1 tab, 9 ref.

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Computer programs, Linear programming, Optimization, Parametric hydrology, Digital computers, Computer models, Model studies.
Identifiers: Nonlinear rainfall-runoff models, Quasilinearization.

Though several investigators have noted the consistent nonlinearity of hydrologic system response to rainfall, nonlinear models have been avoided because of computation difficulties associated with the identification of model parameters from historic records. A few nonlinear models have been proposed, but the parameter identification methods lack generality and the capacity to deal with complex models. Through quasi-linearizati implicit solutions to a large class of nonlin models can be written in terms of a maximiz operation on linear equations. This algorithm a provides for systematic determination of the timal values of model parameters in the identifi tion problem. Furthermore, a complete set of ac rate initial conditions need not be supplied. Ap cation of quasi-linearization to a recent nonlin conceptual model of watershed response displa in particular (1) the simplicity of the computer p gramming through the use of standard subrouti and (2) the rapid convergence characteristics the algorithm. tifiers: Central Valley (Calif).

n-gage data were compared with ground-level ipitation as determined with a highly sensitive meter 20 ft in diameter. Rain gages of various s were tested in the Central Valley of Califor- during 24 storms in the 1966-1968 rainfall ons. Rainfall totals for each storm as measured he lysimeter and by several rain gages in its nity were compared by regression analysis. d effects on a standing gage seemed unimpor- , since agreement was close between a standard ch rain gage mounted in the normal standing tion and a USSR 3000-sq-cm rain gage unted at ground level. Storm totals from these 2 es spaced about 10 ft apart averaged 4% higher n catches measured 450 ft away by the lysimeter a Fischer and Porter digitizing rain gage spaced ut 10 ft apart. Fischer and Porter gage storm ch values varied generally about the mean value he lysimeter data. The coinciding means of all he data from these 2 instruments suggest that d effects compensate over the period of storms lied. (Knapp-USGS)

Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 307-316, 1968. 10 p, 3 fig, 2 tab, 27 ref.

Descriptors: *Meteorology, *Data processing, *Digital computers, *Weather forecasting, Hydrologic budget, Heat flow, Mass transfer, Computer programs, Atmospheric physics, Air masses, Distribution patterns, Evaporation, Humidity, Synoptic analysis.
Identifiers: Flux divergence, Moisture flux.

Terrestrial water budgets may be evaluated by balancing horizontal and vertical transfers of water into and out of the air space above a given drainage basin. Such hydrometeorological studies have been performed for the 5-year period May 1958-April 1963, for the North American region using high-speed electronic data processing machines to perform the analyses. The generation of vertically integrated moisture and moisture transport statistics for some 176 North American stations are described for each of the 60 months based on meterological statistics at each of 16 levels in the atmosphere from the surface to 300 millibars. Covariances were computed for wind components and specific humidity data for each day of the 5 years for each station, then summed and analyzed to yield 89 time-averaged fields (maps) of flux divergence of moisture over North America, and other maps of velocity potential, streamlines, and zonal and meridional transport terms. The complex of computer programs to perform these analyses is described. The resulting inventory of moisture flux data over North America represents the most complete analysis to date of the atmospheric limb of the hydrologic cycle. (Knapp-USGS)

VARIATIONS IN PRECIPITATION FROM THUNDERSTORMS IN THE SOUTHWEST,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
Herbert B. Osborn.
5th Proceed, Conference on Severe Local Storms, Amer Meteorological Society, St Louis, Mo, pp 219-225, October, 1967. 7 p, 7 fig, 2 ref.

Descriptors: *Thunderstorms, *Variability, *Southwest U.S., Arid lands, New Mexico, Arizona, Acreage, Areal, Demonstration watersheds, Rainfall disposition, Small watersheds, Hail, Isohyets, Precipitation intensity, Rain, Weather patterns, Storm runoff.
Identifiers: Alamogordo Creek watershed, Walnut Gulch watershed.

Eleven years of records from dense networks of recording rain gages on 67 sq. mi. Alamogordo Creek watershed (N.M.) and 58 sq. mi. Walnut Gulch watershed (Ariz.) are indicative of thunderstorm patterns in the arid Southwest. Point intensities for 5 min. periods sometimes approached 10 in/hr. on the Walnut Gulch watershed, while on Alamogordo Creek they have exceeded 15 in/hr. Two exceptional storms at Alamogordo Creek produced over 3 in. of precipitation in 15 min. On the Walnut Gulch watershed, the runoff-producing portion of most thunderstorms lasted for less than 15 min. and covered less than 5 sq. mi. 90% of all thunderstorms lasted less than 30 min. Only with intense networks of rain gages is it possible to accurately measure the frequencies of thunderstorms of varying magnitudes and durations on 60 sq. mi. watersheds and on the semiarid rangelands of the Southwest. EFFECTS OF HURRICANE STORMS ON AGRICULTURE,
Colorado State Univ., Fort Collins.
L. M. Hartman, David Holland, and Marvin Giddings.
Water Resources Res, Vol 5, No 3, pp 555-562, June 1969. 8 p, 3 tab, 22 ref.

Descriptors: *Hurricanes, *Damages, *Crop production, Catch crops, Economics, Winds, Rainfall, Infiltration, Runoff, Erosion, Statistical methods, Regression analysis, Storms.
Identifiers: Hurricane effects on agriculture.

Hurricane storms as they move inland are accompanied by rather widespread rainfall. The effect of the rainfall on crop production depends upon the time occurrence of the storm. A statistical time series analysis of the relation between rainfall by time periods and crop yields indicates that rainfall during the major hurricane season (August, September, and October) is damaging to many crops. The analysis consisted of a multiple regression of crop yields on rainfall by 10-day time intervals. The total benefit or loss from any storm would depend upon the time occurrence and the track of the storm. A summary of change by states in total crop value from 1 inch of incremental rainfall for their 5 major crops resulted in both positive and negative totals, depending upon the time period. Predicted changes in yield and crop value for 3 historic storms indicate net losses for 2 storms occurring in August and September and net benefits for 1 storm occurring in July. (Kanpp-USGS)

HEAT BALANCE STUDIES DURING AN ICE-FOG PERIOD IN FAIRBANKS, ALASKA,
Alaska Univ., College. Geophysical Inst.
Gerd Wendler.
Mon Weather Rev, Vol 97, No 7, pp 512-520, July 1969. 9 p, 9 fig, 2 tab, 21 ref.

Descriptors: *Fog, *Alaska, *Ice, *Heat balance, Solar radiation, Heat budget, Weather, Climates, Smog, Air pollution effects, Condensation.
Identifiers: *Ice fog, Fairbanks (Alaska).

Ice fog, which is in a way similar to a dense cirrostratus cloud near the surface, occurs in Fairbanks when the temperature drops below -35 deg. C. The heat balance of two stations, one below the ice fog in the valley and the other one on Birch Hill above the ice fog, are compared for the longest cold spell in winter 1966/67. The valley station shows a relatively small radiative loss of 47 cal per sq cm per day, as the ice fog shelters the surface against a highly negative long-wave radiation balance. The energy for compensation of this loss comes mostly 25 cal per sq cm per day out of the soil. On Birch Hill the radiative loss (124 cal per sq cm per day) is nearly three times larger, mostly due to the smaller amount of the incoming long-wave radiation, and here the sensible heat flux (102 cal per sq cm per day) provides most of the energy. (Knapp-USGS)
W69-08198

A SIMPLE SNOWMELT LYSIMETER,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
Harold F. Haupt.
Water Resources Res, Vol 5, No 3, pp 714-718, June 1969. 5 p, 1 tab, 7 ref.

Descriptors: *Snow, *Lysimeters, *Snowmelt, Instrumentation, Snow cover, Snowfall, Snow management, Streamflow forecasting, Runoff forecasting.
Identifiers: *Snow gages.

A simple gage on the lysimeter principle has been developed to provide continuous readings of the volume of water flowing from the base of a snowpack in the form of surface melt alone or rain percolate and surface melt combined. The data obtained show promise, after two seasons, of being applicable in river flood forecasting, as well as in studies of snow hydrology. (Knapp-USGS)

SNOW ACCUMULATION ON MOUNT LOGAN, YUKON TERRITORY, CANADA.
Cold Regions Research and Engineering Lab., Hanover, N. H.
C. M. Keeler.
Water Resources Res, Vol 5, No 3, pp 719-723, June 1969. 5 p, 4 fig, 1 tab, 10 ref.

Descriptors: *Snowfall, *Cold regions, *Mountains, Topography, Snow surveys, Elevation, Orography, Meteorology.
Identifiers: *Mt. Logan (Canada), Yukon Territory (Canada).

Measurement of snow accumulation for the year from summer 1967 to summer 1968 on Mt. Logan, St. Elias Mountains, Yukon Territory, Canada, indicates that annual precipitation is approximately 0.65 meters per year for elevations between 3350 and 5400 meters. This is less by a factor of 5 than annual precipitation at sea level on the Gulf of Alaska. On a regional basis precipitation decreases inland from the Pacific Ocean at a rate of approximately 0.00002 meters per km. Precipitation decreases on the windward and increases on the leeward sides of the St. Elias Mountains with respect to elevation. (Knapp-USGS)
W69-08207

GLACIER MASS-BALANCE MEASUREMENTS--A MANUAL FOR FIELD AND OFFICE WORK,
Department of Energy, Mines and Resources, Ottawa (Ontario); and Norwegian Water Resources Board, Oslo.
G. Ostrem, and A. Stanley.
Can Dep Energy, Mines and Resources and Norwegian Water Resources and Elec Board Rep, 1969. 127 p, 20 fig, 25 photo, 7 tab, 55 ref.

Descriptors: *Glaciers, *Surveys, *Regimen, Movement, Glaciation, Melting, Suspended load, Scour, Climatic data, Ablation, Snowfall, Melt water, Data collections, Investigations, Mapping, Measurement, Profiles, Surveying instruments, Climatology, Discharge (Water).
Identifiers: *Glaciology, Glaciological field work manual.

Field procedures used by the Canadian Department of Energy, Mines, and Resources and the Norwegian Water Resources and Electricity Board to collect glacial mass-balance data are described in a field manual. The manual describes standard field techniques, outlines practical difficulties and their solutions, gives practical field work hints, and suggests methods of recording, tabulating, and plotting data. Topics discussed include stake networks, accumulation measurements, ablation measurements, plotting and contouring, meteorological observation, water discharge measurements, suspended load measurement, surveying, field camp accomodations, field organization, and office procedures. An extensive bibliography is given. (Knapp-USGS)

THE GENERATION OF SPRING PEAK FLOWS BY SHORT-TERM METEOROLOGICAL EVENTS,
Forest Service (USDA), Moscow, Idaho. Forestry Sciences Lab.
Harold F. Haupt.
Bulletin of the Int. Assoc. of Scientific Hydrology, 1968. 13 (4): 65-76, Illus.

Descriptors: *Peak discharge, *Meteorology, *Rainfall intensity, *Snowmelt, Watersheds (Basins), Streamflow, Snowpacks, Storm runoff, Melt water.
Identifiers: Priest River Experimental Forest, Hydrometeorology.

Spring peak flows recorded over a 25-year period in Benton Creek, a small forested watershed (1.5 mi2) in northern Idaho, were studied in relation to meteorological events. The analysis revealed: (1) Slightly more than one-half of the spring peaks (56 percent) were associated with rain-on-snow events; less than one-half (44 percent) were associated with snowmelt events; (2) the timing of maximum spring discharge for years of rain-on-snow peaks was more closely synchronized with the ending day of maximum rainfall than it was for years of snowmelt peaks with the ending day of maximum temperatures; (3) in some years, heavy rainfall accompanied by relatively high air temperatures affected the generation of spring peak runoff, whereas in other years, heavy rainfall had a strong suppressing effect on air temperature so that snowmelt contribution to runoff was probably less and peak volumes did not occur; and (4) the highest peak runoff of record was a snowmelt event.

Descriptors: *Interception, *Snow, *Coniferous trees, *Idaho, Water loss, Mathematical models, Storage.
Identifiers: Priest River Experimental Forest, Interception storage.

Study of interception storage of snow by two species of sapling conifers in northern Idaho revealed that cumulative snow catch follows a classical law of autokinetic growth, or I (s)= S/ (1+ e to the -k (P-P (o))power) where I (s) is interception storage, S is the interception storage capacity of the tree, e is the base of the natural logarithm, k is a constant expressing the rate of interception storage, P is accumulated snowfall, and P (o) is accumulated snowfall at the time of most rapid storage (i.e., the point of inflection of the sigmoid curve). Interception storage conformed to the law in five storms in which snowfall began while the trees were bare, and in two storms in which snow fell while snow from previous storms persisted on the trees. Several small storms yielded insufficient data to define the appropriate constants, but inspection indicated no serious deviation from the general law.

AVALANCHE TECHNOLOGY AND RESEARCH, RECENT ACCOMPLISHMENTS AND FUTURE PROSPECTS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station
M. Martinelli, Jr.
Weatherwise, Vol 19, No 6, p 232-239, Dec 1966. 7 p, 9 fig.

Descriptors: *Avalanches, Structures, Instrumentation, Meteorology, *Snowpacks, Control structures, *Snow management, Explosions.
Identifiers: Avalanche hazard evaluation, Avalanche forecasting, Avalanche control, Supporting structures, Avalanche control structures, Avalanche research, *Snow avalanches.

Research carried out in 1930 in Switzerland formed the scientific basis of avalanche hazard evaluation from weather factors and avalanche control using structures and vegetation. Some types of avalanche control structures are used to prevent avalanches from starting; other types protect valuable property or confine or restrict avalanche motion. The intentional release of avalanches by explosion is another type of avalanche control. Avalanche motion studies have been carried out in Europe and Japan. European studies are based on hydraulic principles; Japanese on experimental tests and measurements. Avalanche classification and avalanche hazard evaluation are still highly subjective. Research on these and other avalanche topics is underway in many countries. (Martinelli-USDA Forest Service)

AN EXAMPLE OF DAMAGE FROM A POWDER AVALANCHE,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
M. Martinelli, Jr., and K. D. Davidson.
Bulletin of International Association of Scientific Hydrology, XI (e) Annee No 3 pp 26-34, 1966. 9 p, 4 fig.

Descriptors: *Avalanches, *Snowpacks, *Atmospheric physics, *Velocity, Equations.
Identifiers: Powder avalanches, Airblast, Avalanche accident, Avalanche damage, *Snow avalanches.

A powder avalanche moved a 3,200 kg truck 19.8 m horizontally and dropped it 15.2 m into a gully without serious damage. Data from the site are used to compute the velocity of snow-free air and of a snow-air mixture necessary to cause this event. These velocities are found to be within the velocity of the avalanche as estimated from the equations published by A. Voellmy. (Martinelli-USDA Forest Service)

INFLUENCE OF GAP WIDTH BELOW A VERTICAL SLAT SNOW FENCE ON SIZE AND LOCATION OF LEE DRIFT,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
M. Martinelli, Jr.
Bulletin of the International Association of Scientific Hydrology, IX (e) Annee No 4, pp 48-57, 1964. 10 p, 5 fig, 2 tab, 3 ref.

Descriptors: *Snow, *Snow management, *Snowpacks, Structures, Control structures, Meteorology.
Identifiers: Snow fences, Snow accumulation, Snow drifts.

When vertical slat snow fences were built with gaps of 1, 2, and 4 feet below 6 feet of fencing, maximum snow depth and maximum snow volumes were found in the lee drifts behind the fences with the 1-foot gap. As gap size increased, maximum snow depth moved farther from the fence and decreased. The volume of snow in the lee drifts behind fences with 2- and 4-foot was about the same, but amounted to only a little over one-half that behind fences with 1-foot gaps. The 1-foot gap became plugged with snow even in the below-average snow year studied. This caused maximum snow depths to move toward the fence. (Martinelli-USDA Forest Service)

SOME OBSERVATIONS ON TEMPERATURE PROFILES OF A MOUNTAIN SNOW COVER,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
James D. Bergen.
Rcoky Mountain Forest and Range Experiment Station, USDA Forest Service Research Note RM-110, 1968. 7 p, 4 fig, 4 ref.

Descriptors: *Snow, *Snow cover, *Thermal stratification, *Climatology, Mountain forests, Heat transfer, *Density stratification, Temperature, Snow surveys, Microenvironment, Cold resistance.

Measurements of the vertical temperature distribution in an annual mountain snow cover are discussed in terms of a simple model of the vertical temperature profile. The parameters describing this model are compared for measurements made for 2 winters. Day-to-day variation is found to be larger for these parameters than between different months of the same winter or between the 2 winters.

ATMOSPHERIC HUMIDITY MEASUREMENT NEAR THE SNOW SURFACE,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
James D. Bergen.
Rocky Mountain Forest and Range Experiment Station, USDA Forest Service Research Note RM-116, 1968. 4 p, 3 fig, 5 ref.

Descriptors: *Hygrometry, *Boundary layers, *Snow cover, Humidity, Microenvironment, Moisture content, Boundary processes, Evaporation, Latent heat, Vapor pressure, Sublimation.
Identifiers: Bowen ratio.

Describes a technique for measuring atmospheric humidity in the first few centimeters over a snow cover. Results are presented for four observation periods. The water vapor density at a nominal reference level of 2 cm above the snow surface was found to vary from less than 20 percent to 90 percent of the density corresponding to saturation at the snow surface temperature. Little diurnal variation was found for the Bowen ratio. Possible remedies for difficulties encountered in the measurements are described.
W69-08452

SOME MEASUREMENTS OF AIR PERMEABILITY IN A MOUNTAIN SNOW COVER,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
James D. Bergen.
Bulletin of the International Association of Scientific Hydrology, XIII (e) Annee No 3, pp 5-13, 1968. 7 p.

Descriptors: *Snow, *Snow cover, *Snowpacks, *Physics, *Permeability, Mass transfer, Air, Flow resistance, Porous media, Mountain forests, Snow surveys, Sublimation.
Identifiers: *Snow metamorphosis.

Air permeability and density at various levels in an annual mountain snow cover were measured on three separate days in mid-February, early March, and late March, respectively. Permeabilities are presented together with estimates of grain size based on the empirical correlations between grain size and air permeability found in the literature. The variation of air permeability with absolute porosity for various snow types is compared with that found in the literature for a Swiss alpine snow cover and found to be in fair agreement. Grain size

LIBRARY U. OF I., URBANA-CHAMPAIGN

in the depth hoar layer is found to decrease by a third over the last period.

SNOW ACCUMULATION AND MELT IN RELATION TO TERRAIN IN WET AND DRY YEARS,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Henry W. Anderson, and Allan J. West.
33rd Ann Western Snow Conf, Proc (1965): 73-82.

Descriptors: *Snow cover, *Snowmelt, *Environmental effects, Topography, Elevation, Slope, Analytical techniques, Regression, Coniferous forests, Mountains, California, Snowpacks.
Identifiers: *Forest openings, *Principal components analysis.

To determine terrain-snow relations three years with wide differences in snow accumulation and melt,--1958, 1959, and 1960, and snow water equivalent on March 1, April 1, and May 1 in each of those years were analysed separately by regression on principal components. Terrain effects on snow were expressed in two parts: first, the meso-terrain, representing the surroundings within a few hundred or thousands of feet around the course; and second, the local terrain at the snow course. Snow differences with elevation become greater as the season progresses from March 1 to May 1, especially in dry years. One implication is that snow sensors, such as snow pillows or radioactive snow gages, at a single elevation cannot index snow at all elevations in different years. For snow courses in forest openings, the width of the openings had more effect in the year of heavy snowfall than in the dry years. In the wet year, 1958 snow was 3 to 3 1/2 inches greater in an opening 4 tree heights across than in an opening only one tree height across; however, in dry years 1959 to 1960 the differences averaged less than one inch. Cold air drainage obviously plays a role in delaying snowmelt in openings as well as in the forest adjacent to openings. The increase in snow in the downhill half of openings as contrasted to the uphill ranged from 3 to 5.5 in.; in the adjacent forest the downhill portions had 2 to 3.5 inches more, with differences increasing with season (March 1 to May 1).

SNOW ACCUMULATION AS RELATED TO METEOROLOGICAL, TOPOGRAPHIC, AND FOREST VARIABLES IN CENTRAL SIERRA NEVADA, CALIFORNIA,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Henry W. Anderson.
Int Ass Sci Hydrology Publ No 78 (1967): 215-224.

Descriptors: *Snow cover, *Snow management, *Snow fall, *Interception, *Snowpacks, Cloud cover, Advection, Heat budget, Humidity, Solar radiation, Topography, Mountain forests, Watershed management, Analytical techniques, California.
Identifiers: Forest patterns, Forest canopy, Snow distribution, Principal components analysis.

Snow accumulation at individual points in forest and openings in forests was studied by selecting 16 periods in the winter of 1957-58 under different meteorological conditions. Wide differences in topography and forest conditions were obtained by selection of 250 points from 1,300 available. Snow accumulation was the difference in water equivalent of the snow pack between measurements. Meteorological variables included functions of clouds, wind, humidity, temperature, and precipitation. Forest variables included indexes of shade, back radiation, interception, cold air drainage, and shelter from the wind. Topography was expressed in terms of solar energy received and exposure to prevailing winds. The factors related to snow accumulation were studied by reduced rank procedure of principal components, principal axis, canonical, and alpha factoring with varimax rotation of the factors. The best regressions relating the variables to snow accumulation arose from principal components analysis when highly correlated variables were included. Snow accumulation depended strongly on combinations of meteorologic and forest variables, and on forest-meteorologic interactions. Interception of snow, as indexed b the canopy over the point, averaged 10 percent the precipitation. Snow accumulation in fore openings, forest margins, and in large areas uniform forest had different relations to meteorlo ical and topographic variables. Forest shade a back radiation from trees were most important high energy south slopes.

ANTITRANSPIRANTS RESEARCH AND IT POSSIBLE APPLICATION IN HYDROLOGY,
California Univ., Davis.
David C. Davenport, Robert M. Hagan, and Paul I Martin.
Water Resources Res, Vol 5, No 3, pp 735-74 June 1969. 9 p, 4 fig, 1 tab, 33 ref.

Descriptors: *Transpiration control, *Water co servation, Chemcontrol, Stomata, Water yiel Water management (Applied), Watersh management.
Identifiers: *Antitranspirants.

Research on antitranspirants may have applicati in increasing the yield of water from watersheds reducing transpirational losses from vegetati under certain environmental conditions. There a 3 broad groups of antitranspirants: (1) reflecti materials that decrease the heat load on the le (2) film-forming materials that hinder the escape water vapor from the leaf, and (3) stomata-closi materials that increase stomatal resistance. A titranspirants are most effective in decreasi transpiration when other resistances in the passa of water to the roots, through the plant, and to t atmosphere are not great, when there is go coverage of the stomatal bearing leaf surfaces (e cept for reflecting materials), when new fol growth following treatment is minimal, and wh optimum concentrations and application rates used. scriptors: *Evapotranspiration, *Arid climates, umid climates, Elevation, Latitudinal studies, matic data, Energy budget, Heat balance, Irriga-ı effects.

s paper evaluates the concept of potential potranspiration and its relationship to various ıatic conditions. Attempts at measuring poten-evapotranspiration from a growing plant opy are valid only when water is abundant and ımited in the soil profile. Estimations of potranspiration potential from mean tempera-and energy budget data are discussed. In iarid and arid regions the actual evapotrans-ıtion is determined by the amount of precipita-. Analysis shows that use of a method for esti-ing potential evapotranspiration based on the ın temperature will result in no great difference ween the moist and the dry climates at similar latitudes and elevation. Movement toward warmer or cooler climates results in rapid changes of potential evapotranspiration. When high levels of soil moisture are maintained through irrigation, the actual evapotranspiration is nearly equal to the potential evapotranspiration. Potential evapotranspiration is discussed in relation to irrigation problems. (Sherbrooke-Ariz)

WATERSHED THERMAL CLIMATES AND WATER LOSS PREDICTION,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
M. T. Chang, and R. Lee.
Institute for Research on Land and Water Resources, Research Project Technical Completion Report, University Park, Pa., June 1969. 101 p, 24 fig, 24 tab, 54 ref. OWRR A-012-PA.

Descriptors: *Phenology, *Evapotranspiration, Temperature, Climatology, Energy budget, Hydrologic budget, Water yield, Transpiration.
Identifiers: *Temperature measurement, *Pallmann method, Thornthwaite method, Central Pennsylvania.

The Pallmann method of temperature sensing was to obtain space- and time-integrated air temperatures on a 303-acre experimental, forested watershed in central Pennsylvania. The method proved to be a highly sensitive, effective, and economical means of mass-sampling in complex terrain. The field precision was 0.02C, and unit sensor cost was about 15 cents. Watershed thermal climates were correlated with potential direct solar radiation and plant response trends. The season of water use, or elapsed time between leafing-out and leaf coloration, varied systematically with slope zones in the watershed. Climatological data obtained from the most convenient sampling point on the watershed were inadequate as a basis for climatological water balance estimates. Estimates were improved when chemically derived mean basin temperatures were used in conjunction with detailed soils information and plant response data. (Sink-Penn State Univ)

A PRACTICAL FIELD TECHNIQUE FOR MEASURING RESERVOIR EVAPORATION UTILIZING MASS - TRANSFER THEORY,
Geological Survey, Washington, D. C.
G. Earl Harbeck, Jr.
Geological Survey Professional Paper 272-E, p 100-105, United States Government Printing Office, Washington, 1962. 6 p, 3 fig, 5 ref.

Descriptors: *Evaporation, *Energy budget, *Mass transfer, Wind velocity, Vapor pressure, Viscosity, Meteorological data, Seepage.
Identifiers: Lake Hefner study, Lake Mead study, Evaporation-seepage method.

Studies of evaporation made in recent years have provided values of the mass-transfer coefficient, N, in the equation E= Nu2 (eo - ea) for reservoirs having surface areas ranging from 1 to nearly 30,000 acres. The apparent correlation of N with reservoir surface area may in large part be associated with variations in the shape of the wind profile near the surface resulting from differences in surface roughness. It appears that evaporation from many reservoirs can be determined with acceptable accuracy with a fairly simple system of instrumentation, data processing, and analysis. (Sherman-Vanderbilt)

SOIL MOISTURE REGIME EFFECT ON YIELD AND EVAPOTRANSPIRATION FROM WARM SEASON PERENNIAL FORAGE SPECIES,
Agricultural Research Service, Thorsby, Ala. Soil and Water Conservation Research Div.; and Alabama Agricultural Experiment Station, Auburn.
Basil D. Doss, O. L. Bennett, D. A. Ashley, and H. A. Weaver.
Agronomy Journal, Vol 54, p 239-242, 1962. 4 p, 2 fig, 5 tables, 9 ref.

Descriptors: *Soil moisture, Irrigation, Evapotranspiration.
Identifiers: Greenville fine sandy loam, Moisture extractions.

Average yields of warm seasonal perennial forage species increased as soil moisture increased for all species except sericea which yielded highest at the intermediate moisture regime. Total water used depended more upon the amount of available water in the soil than on plant species. Moisture was first extracted at a shallow depth beneath the plant, and then at successively lower depths. (Bennett-USDA Agricultural Research Service)

Descriptors: *Soil moisture, *Water use, Evapotranspiration, Irrigation.
Identifiers: *Nutrient uptake, Greenville fine sandy loam.

Yields of Sudangrass, Starr millet, and Sart Sorghum and evapotranspiration rates increased as available soil moisture level increased. Sart Sorghum produced highest yield at all three moisture regimes. In general, nitrogen and potassium concentrations in plant tissue decreased with increasing soil moisture, but total uptake was usually higher with irrigation. (Bennett-USDA Agricultural Research Service)
W69-08429

EFFECT OF MOISTURE REGIME AND STAGE OF PLANT GROWTH ON MOISTURE USE BY COTTON,
Agricultural Research Service, Thorsby, Ala. Soil and Water Conservation Research Div.; and Alabama Agricultural Experiment Station, Auburn.
B. D. Doss, D. A. Ashley, and O. L. Bennett.
Soil Science, Vol 98, No 3, pp 156-161, Sept, 1964. 6 p, 4 fig, 1 table, 10 ref.

Descriptors: *Irrigation, Moisture use, Moisture content.
Identifiers: Climatic conditions, Greenville fine sandy loam.

The effect of soil moisture regime and stage of plant growth on the rate of water used by cotton was determined on a Greenville fine sandy loam at Thorsby, Alabama, during the 1958 and 1959 growing seasons. Three soil moisture regimes were established: (a) no irrigation, (b) irrigated when 80 per cent and (c) 30 per cent of the available soil moisture had been removed from the surface 24 inches of soil. Soil fertility was maintained at a high level at all soil moisture regimes. The rate of moisture used was dependent on available soil moisture and stage of plant growth. Rate of moisture use increased as the amount of available soil moisture increased. The average rate was generally low in the spring while the plants were small, gradually increased until a maximum rate was reached during the period of blooming and boll development, and then gradually decreased until bolls opened. Maximum moisture-use rates ranged as high as 0.35 inch per day with average daily rates ranging from 0.11 to 0.24 inch, depending upon period of growth and soil moisture regime. MOISTURE USE BY VARIOUS PLANT SPECIES AND ITS RELATION TO PAN EVAPORATION AND NET RADIATION,
Agricultural Research Service, Thorsby, Ala. Soil and Water Conservation Research Div.; and Alabama Agricultural Experiment Station, Auburn.
B. D. Doss, O. L. Bennett, and D. A. Ashley.
ARS Bulletin 41-112, Aug, 1965. 16 p, 7 fig, 5 tables, 16 ref.

Descriptors: *Moisture use, Evapotranspiration, Climate, Pan evaporation, Air temperature, Rainfall.
Identifiers: *Net radiation, Radiant energy, Greenville fine sandy loam.

Moisture use rates by 15 plant species were determined on a Greenville fine sandy loam soil at Thorsby, Alabama, during 1956 to 1962. Average daily moisture-use rates (ET) ranged from 0.03 to 0.24 inch, depending on season of year, available soil moisture, stage of plant growth, and species. In general, moisture-use rates were highest for cultivated crops and lowest for cool season perennial grasses. Moisture-use rates of species with similar seasonal growth characteristics differed little within a group, i.e., cultivated crops, warm season perennial, forages, cool season perennial legumes, and cool season perennial grasses. Moisture-use rates for 10-day periods determined from gravimetric soil sampling at 3- to 5-day intervals throughout the growing season for each species at each soil moisture regime were correlated separately with open pan evaporation and the inches of moisture equivalent of net radiation, assuming a constant value for heat of evaporization. These relations indicate that either open pan evaporation or net radiation may be used to estimate moisture use under conditions where moisture is not limiting, provided a relation has been established for the given species. To estimate moisture use on a daily basis, the appropriate ET/E or ET/Rn ratio is multiplied by the measured daily pan evaporation or inches moisture equivalent of net radiation. EVAPOTRANSPIRATION AT A WYOMING MOUNTAIN BOG,
Forest Service (USDA), Laramie, Wyo. Rocky Mountain Forest and Range Experiment Station.
David L. Sturges.
J Soil and Water Conserv, 1968, 23 (1): 23-25, Illus.

Descriptors: *Evapotranspiration, *Bogs, *Evaporation pans, Phreatophytes, Consumptive use, Fen, Wyoming.
Identifiers: Potential evapotranspiration.

Computed potential evapotranspiration and pan evaporation were compared during three, 5-day intervals spaced through the growing season at a mountain bog in Wyoming's Medicine Bow Mountains. Pan evaporation was also compared with actual bog evapotranspiration on 6 days during a single growing season. Evaporation from a 6-foot diameter sunken pan averaged 0.144 inch per day. Potential evapotranspiration was calculated from a graphical solution of Penman's equation and averaged 0.100 inch per day. A prediction equation for computing potential evapotranspiration from daily pan evaporation was developed. Actual bog evapotranspiration was measured in bottomless caissons either 39 or 72 inches in diameter operated with the water table at the peat surface. Pan evaporation averaged 0.104 inch on the 6 days while bog evapotranspiration was 27 percent greater or 0.132 inch.

Watershed evapotranspiration depends on the s tial and temporal confluence of water and ther energy at watershed surfaces. Four categories surfaces may exist: (1) external surfaces of lea and plant stems, (2) internal plant surfaces, (3) surface, (4) snowpack surface. Water becon present on these surfaces through interception precipitation, absorption and transport of water by plants, capillary flow of soil water, and snow accumulation. Generally, radiant energy the main source of the heat of vaporization. any mass of vegetation per unit of land ar evapotranspiration should be maximum when pl substance is most uniformly distributed through the growing space. Interception of precipitati and radiation, and transport of soil water to tra piring surfaces are then maximum. Forest mani lation, such as partial clearing, caus heterogeneity in canopy and root distribut should minimize evapotranspiration. To be eff tive, persistent discontinuities must be produce the canopy and/or root network. Substitution vegetation of shallower root and/or canopy de longer dormant season, or lower transpiration ra are other means by which watershed managem can reduce evapotranspiration.

scriptors: *Mathematical models, *Computer dels, *Flood routing, *Digital computers, lrographs, Stage-discharge relations, River casting, Flood forecasting, Streamflow casting, Water management (Applied). ntifiers: Romania, Rating curves.

ne applications of digital computers in solving d routing and flood forecasting problems are ented. To reproduce the phenomenon of a d wave propagation in an open channel, a hematical model based on a finite difference me for numerical integration of Saint Venant's ations is used; in this model boundary condis such as those given by tributaries, lateral harges or local head losses, can easily be inuced. A mathematical model was used in the of the Danube and Prut Rivers with embanked nels. The possibilities and conditions to simplihe equations are discussed. The use of the nematical model for a short time forecast of a d wave propagation on the lower stretch of ube is outlined. Difficulties arise in the case of untrained river channels with wide flood plains; attempts to solve them are discussed. (Knapp-USGS)

SOME PROBLEMS OF STREAMFLOW FORECASTS BASED ON INFORMATION THEORY,
Research Inst. for Water Resources Development, Budapest (Hungary).
K. Body, G. Erdos, and K. Szesztay.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 280-288, 1968. 9 p, 7 fig.

Descriptors: *Streamflow forecasting, *Routing, *Discharge (Water), Stage-discharge relations, Computer programs, Digital computers, Streamflow, Stream gages, Statistical methods.
Identifiers: River travel times, Information theory.

Regularities of the streamflow regime of a river system may be described by relations between the discharges of selected gaging stations. On the basis of data of 17 stations for about 2000 days, analyzed by digital computer systems, stage-discharge relations were determined to forecast discharges of the Danube River at the Iron-Gate section for 5 and 10 day periods. Travel times may be determined even under conditions of backwater effect. Utilizing the new possibilities offered by the computers, special forecast equations have been established for each day on the basis of the data most characteristic of the streamflow regime conditions of the given day. LAG TIME OF NATURAL CATCHMENTS,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
Arthur J. Askew.
New South Wales Univ Water Res Lab Rep No 107, July 1968. 209 p, 42 fig, 10 tab, 52 ref, 5 append.

Descriptors: *Rainfall-runoff relationships, *Routing, *Runoff forecasting, *Mathematical models, *Computer programs, Hydrographs, Hyetographs, Hydrograph analysis, Synthetic hydrology.
Identifiers: Lag computation (Runoff).

An investigation was made of the values of lag time for natural catchment areas, as measured from center of mass of excess-rainfall to center of mass of resulting runoff. Any variation in this value for an individual catchment is an indication of a nonlinear response. Values of lag were measured for a range of floods on 5 catchment areas. The difference in value between catchments was found to be a function of the catchments' characteristics, while variation in the values for an individual catchment was strongly related to the magnitude of the floods. As the degree of this variation was fairly constant for the areas studied, the degree of nonlinearity was also considered to differ little between the catchments. The development of 3 general formulae required a detailed analysis to be made of a large volume of hydrologic data by an objective systematic procedure. For this purpose lag was measured to the center of mass of direct runoff and a weighted mean discharge measure of flood magnitude was devised. Numerous hyetograph characteristics were measured and studied, but none appeared to have any significant influence on the value of lag time. Computer program listings for computing lag-discharge relationships and for regression analysis of lag-discharge relationships are included. (Knapp-USGS)

DROUGHTS IN FINNISH WATERCOURSES WITH REFERENCE TO WATER SUPPLY AND POLLUTION CONTROL (FINNISH),
Finnish Hydrological Office, Helsinki.
Eero Kajosaari.
Helsinki, Painovalmiste, 1968. 118 p, 24 fig, 12 tab, 91 ref.

Descriptors: *Drought, *Streamflow forecasting, Streamflow, River regulation, Water storage, Lakes, Statistical methods, Duration curves, Hydrographs, Frequency analysis, Water management (Applied).
Identifiers: *Finland.

Droughts and water-supply problems in Finland are discussed from the point of view of water supply and hydroelectric power management. A drought is defined as a period longer than 6 months with a mean runoff less than the mean runoff of the entire period of record of the watercourse. The 17 analyzed watercourses are unregulated. Dry periods of 5, 15, 31, 61, 91, 121, and 151 days were analyzed by digital computer. To describe numerically the characteristics of dry periods, the concept of specific deficit was used. It is the hypothetical storage volume per unit of catchment area required to maintain runoff equal to the long-term mean runoff during periods of droughts. Increasing catchment size and increasing lake influence diminish the difference between long-term and short-term drought runoff, but have no effect on relative drought severity. The results of frequency analysis are used to estimate long-term safe yield. (Knapp-USGS)

EFFECT OF HEAVY LATE-FALL PRECIPITATION ON RUNOFF FROM A CHAPARRAL WATERSHED,
Rocky Mountain Forest and Range Experiment Station.
Paul A. Ingebo.
USDA Forest Service, Research Note RM-132. 2 p, 1969, 2 fig.

Descriptors: *Rainfall-runoff relationships, *Water storage, *Arizona, Arid lands, Chaparral, Demonstration watersheds, Water balance, Storm runoff, Rainfall, Streamflow, Time log, Hydrologic budget, Flow characteristics, Hydrologic equation, Regulated flow, Water yield, Recharge, Overburden.

Nov/Dec precipitation in 1965 at Three Bar experimental watershed, Arizona, measured 24.29 in., about 7 times the preceeding 9-yr. average. Streamflow during this period was 2.4 area-inches. A water balance equation indicated a 19.9 in. increase in stored water. Streamflow responded little to the 8 in. of rainfall in Nov., presumably because of soil-water deficits. But, with additional precipitation in early Dec. streamflow responded markedly, even though storage also increased. The uniform rate of streamflow (during most of Dec.) compared to the more sporadic rainfall suggests a continuing buffering action in movement of water through the watershed. A recession-type flow continued until mid-Jan. and is thought to have extended through the period of light spring rains. Rational solution of the water balance equation necessitates recognition of the storage potential within the watershed. This storage potential is a peculiarity of the regolith; thus, the depth and characteristics of the overburden appear to be important considerations in studying water yields, storage, and flow behavior of watersheds. (Sherbrooke-Ariz)

STREAMFLOW - AN IMPORTANT FACTOR IN FOREST MANAGEMENT IN THE COASTAL PLAIN,
Forest Service (USDA), Charleston, S. C. Southeastern Forest Experiment Station.
Cortland E. Young, Jr.
South Lumberman 215 (2680):109-110, Dec 1967. 2 p, 2 fig.

Descriptors: *Streamflow, *Forest management, *Storm runoff, *Design criteria, Drainage, Bridges, Atlantic Coastal Plain, Wetlands, Forests, Water resources, Low flow, Weirs.

This paper discusses the importance of streamflow to the forest manager in the lower coastal plain and presents an example of streamflow behavior from a forested watershed. Streamflow data are needed to aid in drainage system and bridge designs and water resource development. Streamflow records to date indicate that the amount of stormflow produced from a lower coastal plain watershed is highly dependent on the storage potential of the watershed prior to rainfall. On the average this watershed produces more stormflow than forested watersheds in the mountains and Piedmont; however, streamflow from our watershed is intermittent with no flow periods as long as 1 to 2 months occurring each year.

FORECASTS WITH VARYING RELIABILITY,
Harvard Univ., Cambridge, Mass.
Myron B. Fiering.
Proc, Amer Soc Civil Eng, Vol 95, No SA3, p 629-644, June 1969. 16 p, 2 tab.

Descriptors: *Streamflow forecasting, *Variability, *Mathematical models, *Optimization, *Design, Systems analysis, Water resources, Monte Carlo Method, Operations, Reliability, Computers.

An application of computing and systems analysis techniques to water resources design was made. The objective of the study was to combine the selection of components, the specification of optimal operating policies and the role of streamflow forecasting in a single mathematical entity. No formalism for forecasting was given, but based on a model for flow sequences, a technique was developed by which the analyst could discern whether or not it was useful to include forecasting in the operating policy. The procedure made use of statistical theory and the Monte Carlo Method. Subsequent work particularly that which involved mathematical programming offered new insights into the construction of optimal operating schemes. By means of regression analysis it was possible to construct operating rules which explicitly accommodated flow forecasts of different reliability. (Thiuri-Cornell)

RANDOM WALK AND RANDOM ROUGHNESS MODELS OF DRAINAGE NETWORKS,
Technion - Israel Inst. of Tech., Haifa. Dept. of Agricultural Engineering.
Ido Seginer.
Water Resources Res, Vol 5, No 3, p 591-607, June 1969. 17 p, 11 fig, 2 tab, 18 ref.

Descriptors: *Drainage patterns (Geologic *Topography, *Statistical models, Stochast processes, Probability, Monte Carlo metho Streams, Drainage systems, Watersheds (Basins).
Identifiers: Drainage geometry, Topographi roughness, Random walk method.

A random walk model of a drainage network generated on an underlying matrix by selecting random the drainage direction out of the element ry areas. In a random roughness model, roughne heights of the elementary areas rather tha drainage directions are assigned at random. Th resulting topography of that model then unique determines the drainage pattern. An equivalence the 2 models is suggested by the similarities foun in the mode of construction and by the equality the probabilities of occurrence of some simple co figurations. The random roughness model can yie values of primary probabilities, i.e., probabilitie which can be used in the construction of a rando walk model. The various types of drainage patter are classified by the sets of primary probabilitie which would generate them. Thus outcomes homogeneous and isotropic matrices are classifie as pure dendritic patterns. Outcomes of homogene ous matrices with probability sets derived from sloping plane roughness model are classified general dendritic (including parallel) pattern Trellis, annular, and other patterns are considere as subgroups of the class of patterns generated all other possible matrices. iptors: *Water resources, *Oregon, *Surface s, *Groundwater, Streamflow, Aquifers, r supply, Water utilization, Water quality, r yield, Water management (Applied), logic data, Data collections.

n has a large supply of water, but it is nly distributed with respect to both area and Floods and shortages of water are frequent. climate of the western third of Oregon is cterized by moderate temperatures, wet win- and dry summers; about 78% of the annual pitation occurs in the period October to March. The eastern 2/3 of the State has greater extremes of temperature but less seasonal variation in precipitation; about 65% of the precipitation occurs in the period October to March. The average annual precipitation ranges from about 200 in. at places in the Coast and Cascade Ranges to less than 10 in. in parts of north-central and southeast Oregon. The statewide average is about 27 in. per yr. Flooding and drought are due to natural causes and have been alleviated in some areas by storage, drainage, diking, and irrigation. In some places groundwater is too highly mineralized for most uses. Repeated use of water for irrigation tends to increase the concentration of dissolved minerals. Nutrients stimulate undesirable algal growths in rivers and lakes. Municipal and industrial wastes at times deplete the natural supply of dissolved oxygen in streams and thus block the passage of migrant anadromous fish. One of the most difficult problems is to balance the divergent interest of those who recognize the growing needs for use and control of the State's water supplies. Streamflow and groundwater availability in Oregon's rivers and groundwater basins are summarized and the data are tabulated. (USGS)

Identifiers: USSR.

The annual volumes of river runoff constitute a sequency of random variables. In studies of runoff regulation, there is a tendency to replace the theory of random events with the theory of stochastic processes, using the analysis of alternation of runoff volumes during high and low water phases and correlating runoff between contiguous time intervals. The literature of stochastic hydrology is surveyed, summarized, and presented systematically in a form intended to aid in further research and development of the techniques of using stochastic methods in river management, but not as a textbook or manual for computations. The principal aim is to help develop methods for reducing stochastic problems to algorithmic form for computer processing, and to apply the stochastic method to regulation. No advanced or specialized mathematical background is necessary for comprehension of the book, but a good general knowledge is required. A bibliography of the basic work in the field is included. GROUND WATER RESOURCES IN THE KOCHI PLAIN, SOUTHWEST JAPAN (JAPANESE),
Industrial Science and Technology Agency, Kawasaki (Japan). Geological Survey.
S. Takahashi, and S. Nagai.
Bull Geol Surv of Japan, Vol 19, No 10, pp 13-29, Oct 1968. 17 p, 19 fig, 2 tab, 5 ref.

Descriptors: *Aquifers, *Water resources, *River basins, Water supply, Artesian wells, Water table, Subsidence, Earthquakes, Salinity, Chlorides, Streamflow, Water resources development.
Identifiers: *Japan, Kochi Plain (Southwest Japan).

Groundwater resources of the Kagami, Kokubu, and Monobe river basins of southwest Japan were studied with regard to geohydrological conditions. Withdrawals total about 51,100 cubic meter per day, of which 21,900 cu m is artesian water and 29,200 is from water table aquifers. Recharge of the artesian aquifers in the Kokubu River estuary area is from streamflow of Kokubu and Kagami Rivers. It is of interest that this area is characterized by land subsidence cause by a strong earthquake in 1946 and since that time contamination of the groundwater has increased, reaching 5000-15,000 ppm of chlorine. In general, the Monobe River basin can be considered as having good possibility for the further development of groundwater resources in the Kochi plain. (Gabriel-USGS)

GEOHYDROLOGIC SUMMARY OF THE PEARL RIVER BASIN, MISSISSIPPI AND LOUISIANA,
Geological Survey, Jackson, Miss.
L. W. Lang.
Geol Surv Open-file Rep, 1967. 44 p, 10 fig, 2 plate, 4 tab, 41 ref.

Descriptors: *Water resources, *Geohydrologic units, *Streamflow, *Surface-groundwater relationships, *Mississippi, Aquifers, Appraisals, Environment effects, Rainfall disposition, Water quality, Water users, Saline water, Estuaries, Low flow, Storage capacity, River basins.
Identifiers: *Pearl River basins, Potential water sources, Low flow yields.

LIBRARY U. OF I., URBANA-CHAMPAIGN

The environmental framework of the 8,760 sq mi Pearl River basin, Mississippi and Louisiana, is described and appraised as to the quantity and quality of available water by basin segments both in aquifer units and a streamflow. The report discusses present use of the aquifers and surface waters, relationship of groundwater to streamflow, aquifer and well characteristics, and potential sources of supply including saline water as a resource. An annotated bibliography of 41 selected reports is included. Fresh groundwater occurs from the surface to depths ranging from sea level in the upper basin segment to more than 3,000 ft. below sea level in the lower segments; a total of 3 billion ac ft of water is in aquifer storage. Of the average annual rainfall on the river basin (26 million acre ft), about 9 mil ac ft is recoverable from aquifers and streamflow for water supply. Low flow yields vary from 0.20 cu ft/sec per square mile of drainage area in a reach of the basin underlain by permeable sandy deposits to 0.05 cfs per sq mi of drainage area where the basin is formed in clay, marl, and finer sands. Wells with pumping rates of 500 to 1,000 gpm are common basinwide, and some deep wells in the central lowlands flow at rates up to 3,500 gpm. Nearly all the groundwater in the 6 or more major aquifer systems is of good to excellent quality, and streamflow is even less mineralized (median dissloved solids 50 ppm or less at 10 sites in the basin). The basin estuary is a potential source of freshwater (less than 1,000 ppm dissolved solids) to moderately saline water (3,000 to 10,000 ppm) that will require special planning and management for many uses. TRACING GROUNDWATER WITH CHLORIDE IONS AND TRITIUM THROUGH ACID KAOLINITIC SOIL,
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
J. C. Corey, and J. W. Fenimore.
Intern'l Journ. Appl. Radiation and Isotopes, Vol 19, No 10, pp 741-746, 1968. 5 p, 4 fig, 13 ref.

Descriptors: *Groundwater movement, *Radioactive tracers, *Acidic soils, Aquifers, Retention, Kaolinite, Heavy water, Chlorides, Ions, Soil water movement, Arid climates, Wet climates.

Recent investigations with chloride ions in soils from arid regions concluded that chlorides are equal or preferable to tritium as groundwater tracers. These soils are normally neutral to basic, and do not retain anions. The present study utilized acid kaolinitic clays, from regions of abundant rainfall. It demonstrates that the breakthrough for chloride was retarded more than that for tritium, indicating interaction of chloride ions with acid soils. Thus chloride and other negatively charged ions, which may be preferable in many arid regions, have limited usefulness as water tracers in acid soils. (Sherbrooke-Ariz)

GEOLOGY AND GROUNDWATER OCCURRENCE IN SOUTHEASTERN McKINLEY COUNTY, NEW MEXICO,
Geological Survey, Washington, D. C.
James B. Cooper, and Edward C. John.
New Mexico State Engineer, Tech Rept No 35, 1968. 108 p, 7 fig, 2 pl, 5 tab, 58 ref.

Descriptors: *New Mexico, *Groundwater, Semiarid climate, Uranium Radioisotope, Radioactivity, Aquifer characteristics, Artesian well, Deep wells, Depth, Geologic formations, Groundwater mining, Groundwater recharge, Hydrogeology, Transmissivity, Underground storage, Water table, Water chemistry, Shallow wells.
Identifiers: McKinley Co., New Mexico.

This semiarid area of about 1,300 sq. mi. is topographically diverse, without perennial streams or large permanent bodies of surface water. Groundwater, commonly under artesian pressure, is yielded to wells from at least 16 distinct aquifers. Yields of 300 g.p.m. or more are obtained from wells that tap the aquifer in the Glorieta Sandstone and San Andres Limestone. The other aquifers commonly yield only 5 to 30 g.p.m. Well depth ranges from 20 ft. to more than 1,200 ft., while water levels range from above surface to about 800 ft. below. Water quality varies widely, but most groundwater is chemically suitable for stock and domestic use. Most aquifers receive only scant recharge directly from precipitation because their outcrop areas are small. In most of the area withdrawals are minimized by the dominance of ranching. Since 1951 mining of uranium ore and related groundwater withdrawal in the Ambrosia Lake and Smith Lake areas has created widespread interest in the occurrence, control, and disposal of groundwater. Water associated with uranium deposits is slightly radioactive. The availability, quantity and quality of groundwater are related to the geologic regimen. (Sherbrooke-Ariz)

GROUNDWATER RESOURCES OF UPTON COUNTY, TEXAS,
Geological Survey, Washington, D. C.
D. E. White.
Texas Water Develop Bd, Rept 78, May, 1968. 132 p, 21 fig, 7 tab, 42 ref.

Descriptors: *Water resources, *Texas, Arid lands, Aquifer characteristics, Depth, Discharge, Geologic formations, Groundwater mining, Groundwater recharge, Hydrogeology, Hydrologic aspects, Observtion wells, Overdraft, Transmissivity, Underground forage, groundwater movement, Water table, Water sources, Water supply, Topography, Drainage, Geohydrologic units, quifers, Water chemistry, Brine disposal, Sulfates, Fluorides, Dissolved solids.
Identifiers: *Upton Co.

Upton County, in western Texas, is semiarid in climate, with a high rate of evaporation and occasional years of rainfall as low as 6 inches or less annually. The county's groundwater resources are insufficient to furnish all the water needs of cities, industries, irrigation and livestock; consequently, water is imported from adjoining counties. Increased utilization of the Trinity Sand aquifer is resulting in an acceleration of the rate of water-level decline and a concomitant decrease in yields. New large-scale development should be located in new areas and wider spacing of wells and smaller yields should be considered. Chemical analysis shows that few of the Trinity Sand wells meet the standards of the U. S. Public Health Service, the sulfate, fluoride and dissolved-solids concentrations being too high. The present study yielded evidence that some of the wells have been contaminated, presumably from the disposal of oil-field brines into unlined surface pits. A network of 6 observation wells has been established. (Sherbrooke-Ariz)

Identifiers: *Saudi Arabia.

The purpose of this paper is to draw attentio the groundwater potential of the karst aquife Saudi Arabia before the sandstone aquifers proach full development. The discussion of ge hydrogeological conditions includes details of bonate and sulfate formations. Karst formation preservation is considered in relation to (1) space and openings in carbonate rocks, development of joints and fissures, (3) enlarge of openings, joints and fissures, (4) marine ero of karst surfaces, and (5) infilling of karst openi Data are presented on water chemistry. Man the carbonate waters are acceptable for most poses, while the sulfate waters (where free chloride additions) would generally be accept for irrigation uses. On the basis of location, geol cal history, stage of present development and ture development potential, these karst aquifers divided into 3 groups for discussion. The karsti aquifers may in the long run prove as valu water producers in Saudi Arabia as the sandst aquifers. (Sherbrooke-Ariz)

EFFECT OF SEDIMENT CONCENTRATION ON WELL RECHARGE IN A FINE SAND AQUIFER,
Texas A and M Univ., College Station; and Florida Univ., Gainesville.
Md. Ataur Rahman, Ernest T. Smerdon, and Edward A. Hiler.
Water Resources Res, Vol 5, No 3, p 641-646, June 1969. 6 p, 7 fig, 2 tab, 6 ref.

Descriptors: *Recharge wells, *Sedimentation, Clays, Model studies, Hydraulic models, Filtration, Sands, Permeability, Porosity, Hydraulic conductivity, Aquifers.
Identifiers: Well-filter clogging, Formation clogging, Aquifer testing.

A model recharge well was constructed to simulate recharge into wells in a fine sand aquifer. The sand in the model aquifer was uniform fine sand and had a uniformity coefficient of 1.25 and an effective diameter of 144 microns. Both clear tap water and sediment-laden water were used for recharge. Sediment-laden water was obtained by mixing 50% bentonite and 50% kaolinite with tap water. Sediment concentrations were 100, 200, and 500 ppm. The piezometric surfaces near the recharge well were measured during the tests. Migration of sediment into the aquifer was determined by sampling the aquifer sand after the tests at predetermined distances from the well. The sediment in the recharge water highly affected the rate of recharge. During the period of the tests a reduction in hydraulic conductivity of the model aquifer of 15-46% occurred as a result of recharge with sediment-laden water. Most of the sediment deposited in the aquifer was retained near the well screen. (Knapp-USGS)

SIMILARITY APPROXIMATION FOR THE RADIAL SUBSURFACE FLOW PROBLEM,
Drexel Inst. of Tech., Philadelphia, Pa.
R. L. Drake, F. J. Molz, Irwin Remson, and A. A. Fungaroli.
Water Resources Res, Vol 5, No 3, pp 673-684, June 1969. 12 p, 3 fig, 1 tab, 12 ref.

Descriptors: *Mathematical models, *Mathematical studies, *Approximation method, *Groundwater movement, Flow, Porous media, Saturated flow, Unsaturated flow, Synthetic hydrology, Simulation analysis, Computer programs, Digital computers.
Identifiers: *Similarity approximation, Radial groundwater flow.

A useful mathematical technique in the study of radial flow of underground water is the application of similarity transformations, such as Boltzmann's transformation. The transformations lead to approximations that are shown to be valid if certain physical parameters satisfy given limiting conditions. A nonlinear partial differential equation is formulated describing the radial flow of soil moisture. A similarity approximation is used to transform the partial differential equation into a nonlinear ordinary differential equation. Criteria by which to judge the applicability of the similarity approximation are derived. Several monotonicity properties of the transformed moisture as a function of the similarity variable are derived. The properties are used to develop numeric procedure for the solution of the transformed equation. The procedure is used to study the radial flow of soil moisture to a cylindric sink for diffusivities which vary linearly, quadratically, and exponentially with soil moisture. The solutions show that the moisture front steepens with increasing nonlinearity. (Knapp-USGS)

TWO-DIMENSIONAL SEEPAGE OF BONDED WATER TO FULL DITCH DRAINS,
Iowa State Univ., Ames. Dept. of Agronomy.
A. W. Warrick, and Don Kirkham.
Water Resources Res, Vol 5, No 3, pp 685-693, June 1969. 9 p, 4 fig, 8 ref. Grant No WP-00070-05 (PHS).

Descriptors: *Drainage systems, *Ditches, *Seepage, *Mathematical models, Synthetic hydrology, Drainage engineering, Dewatering, Hydraulic conductivity, Anisotropy, Soils, Soil water movement, Groundwater movement.
Identifiers: Nomogram.

Seepage of ponded water to full, equally spaced ditch drains is analyzed mathematically, considering 4 distinct cases. In the first case, an impermeable soil barrier is present at a finite depth, and the ditches are a finite distance apart; in the second case, no impermeable soil barrier is present, and the ditches are a finite distance apart; in the third case, an impermeable barrier is present, but the ditches are in effect an infinite distance apart; and in the fourth case, no impermeable barrier is present, and the ditches are in effect an infinite distance apart. The ditches may penetrate part or all of the way to an impermeable barrier. Schwartz-Christoffel transformations are used to solve the first case. Solutions for the other 3 cases are found by taking limiting values of the first case. Flow nets illustrate the results. In one calculated example, the flow rate without an impermeable barrier is 10% greater than when an impermeable barrier exists at a depth of 0.2 times the ditch semispacing. The flow nets illustrate the rapid decrease in surface water intake at increasing distances from the ditch. A nomogram gives seepage rates when no impermeable barrier is present and infinitely wide spacing is used. An illustration shows that the nomograph is useful to estimate seepage rates for flow media of finite depth and width. (Knapp-USGS)

SOIL SLIPS RELATED TO VEGETATION, TOPOGRAPHY, AND SOIL IN SOUTHERN CALIFORNIA,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
R. M. Rice, E. S. Corbett, and R. G. Bailey.
Water Resources Res, Vol 5, No 3, pp 647-659, June 1969. 13 p, 1 fig, 7 tab, 18 ref.

Descriptors: *Mass wasting, *Soil-water-plant relationships, Landslides, Saturation, Hydraulic conductivity, Soil texture, Vegetation, Topography, Soil conservation, Soil mechanics.
Identifiers: *San Dimas Experimental Forest (Calif), Soil slips.

Soil slippage, a form of shallow mass soil movement, was studied on the San Dimas Experimental Forest in southern California after several large storms in 1965 and 1966. The 3-part study consisted of analyzing topographic data from 200 random points measured photogrammetrically; measuring soil texture, soil depth, wettability of surface soil, and hydraulic conductivity of slip surface on slipped and stabel sites; and mapping and analyzing soil slips to assess the effects of watershed variables. All slips occurred on slopes greater than 80%. The occurrence of slips was inversely related to the size and density of vegetation. In brush areas, northerly aspects were more stable than southerly ones. Conversion from brush to grass on the experimental forest may have resulted in an additional 135 cu m/ha of soil slip erosion during the winter of 1965-1966. (Knapp-USGS)

THE VERTICAL MOVEMENT OF WATER IN STRATIFIED POROUS MATERIAL. 2. TRANSIENT STAGES OF DRAINAGE TO A WATER TABLE,
Cambridge Univ. (England). School of Agriculture.
M. Bybordi.
Water Resources Res, Vol 5, No 3, pp 694-697, June 1969. 4 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Infiltration, *Seepage, *Percolation, Saturated flow, Unsaturated flow, Wetting, Submergence, Hydraulic conductivity, Soil water movement, Water yield, Model studies, Hydraulic models, Mathematical studies, Water table.
Identifiers: Vertical soil water flow.

An equation is derived using the Green and Ampt concept to describe the yield of water at a given time from a freely draining composite column of initially saturated porous materials in a gravitational field. The equation is supported by experimental results. The agreement between computed and observed curves of drainage from composited columns is fairly satisfactory but not as good as in the case of infiltration. The reason is in part because the shape of the moisture profile for drainage is less abrupt than for infiltration, so that the condition for the validity of the Green and Ampt approximation is not so well satisfied. At the same time the less well defined water front introduces greater experimental uncertainties. The air entry pressure exhibits hysteresis and is greater for drying than for wetting; during wetting the whole pore space must be filled from dryness to saturation, whereas drainage releases only a portion. When the coarser sand is at the bottom the water front comes to rest in a lower position than when the finer sand is below the coarser. (Knapp-USGS)

ON THE SOLUTION OF THE PROBLEMS OF INFILTRATION WITH THE AID OF ELECTRONIC COMPUTERS (FRENCH),
Institute of Hydrotechnical Research, Bucharest (Rumania).
Vitalie Pietraru.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 175-188, 1968. 13 p, 7 fig, 2 tab, 8 ref.

Descriptors: *Mathematical models, *Seepage, *Surface-groundwater relationships, *Digital computers, Numerical analysis, Groundwater movement, Darcy's law, Flow nets, Synthetic hydrology, Analog models.
Identifiers: Romania.

New digital computers can be used for solution of complicated seepage problems by means of numerical methods. Investigations in progress by several research workers from various countries have not been generally successful in spite of several satisfactory results obtained so far. Assuming Darcy's law is valid, the study of groundwater motion through homogeneous and isotropic permeable media consists in a single integration, known as the relaxation and overrelaxation method. The optimal overrelaxation coefficient was determined taking into account Young and Thirriot's investigations. The boundary conditions are described as well as the rational computation schemes adequate for several problems in seepage through homogeneous media. The results are given as spectra of equipotential and flow lines. A comparison of the results obtained from numerical computation on digital computers with the results provided by electric analog models shows that the analogs are still advantageous in the case of homogeneous media with simple boundary conditions. Numerical methods should substitute gradually for the conventional techniques now in use (analytical, analog, graphical, and physical models). (Knapp-USGS)

Identifiers: Histosols.

Selected hydrologic characteristics of peat fr
Wyoming mountain bog were measured i
laboratory and in the field. Sample depths we
13 and 13-25 cm. in moderately decomposed
face peat, and 36-48 cm. in decomposed peat.
densities were 0.160, 0.208, 0.216, g/cc. at
depths, respectively. Water yields at these re
tive depths were 0.223, 0.140, and 0.076 c
between saturation and 0.10 bar suction,
0.500, 0.458, and 0.349 cc./cc. between satur
and 1.00 bar suction. Both bulk density and
retention were related to the degree of decom
tion and thus to pore size distribution. Surface
contained large voids which emptied at low
tions, but greater suctions were required to
the smaller pores of decomposed material. Hy
lic conductivity measured in situ at depths
and 91 cm. was 23.9 x 10-3 and 16.1 x 10-3 cm
day, respectively.

riptors: *Rainfall-runoff relations, *Peak arges, *Storm runoff, *Hydrologic properties, ershed management, *Burning, Reforesta- Ferns, Trees, Analytical techniques, Hawaii. ifiers: Principal components analysis.

mflow from two 30-acre watersheds near olulu was studied by using principal com- nts regression analysis. Models using data on hly, storm, and peak discharges were tested st several variables expressing amount and in- y of rainfall, and against variables expressing edent rainfall. Explained variation ranged 78 to 94 percent. The analysis provided some as to the dominant hydrologic processes three different watershed conditions. The of change in the coefficients relating precipita- o runoff in the pre- and post-fire periods may terpreted as indicating that the burning of the shed had little effect on the infiltration or per- ng capacity--at least not in the range such as ect rainfall excess or storm interflow or both. On the other hand, the increase in the regression constant indicates that the burning of the watershed had its expected effect in reducing any storage that was readily available for evaporation, such as the interception storage.

SURFACE SOIL TEXTURE AND POTENTIAL ERODIBILITY CHARACTERISTICS OF SOME SOUTHERN SIERRA-NEVADA FOREST SITES,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Donald W. Willen.
Proc Soil Sciences Soc of America, Vol 29, No 2 (1965): 213-218.

Descriptors: *Erosion, *Soil aggregates, *Cohesion, *Soil formation, *Laboratory tests, Soil sampling, Basalts, Igneous rocks, Vegetation effects, Humid climates, Mapping.
Identifiers: Erodability, Erosion ratios.

Analyses of soil texture and potential erodibility were made on 208 samples of residual upland forest soils, collected at elevations of 6500 to 8,500 ft. Multiple regression tests showed that soil texture and erodibility indices were significantly related to variation in parent rock type, vegetative cover type, aspect, slope, elevation, and their interactions. Prediction equations imply that granitic forest soils at high elevation may be twice as erodibile as soils developed under similar soil-forming conditions at low elevations. Coefficients permitting estimations of soil texture, aggregation, dispersion ratios and surface-aggregation rates are given.

NITROGEN FIXATION IN SOME ANOXIC LACUSTRINE ENVIRONMENTS,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
Patrick L. Brezonik, and Carol L. Harper.
Science, Vol 164, pp 1277-1279, June 1969. 1 tab, 27 ref.

Descriptors: *Nitrogen fixation, *Lakes, Dystrophy, Nitrogen cycle, Eutrophication, Bacteria, Cycling nutrients, Cyanophyta, Limnology, Nitrogen compounds, Enzymes, Environmental effects, Gas chromatography, Wisconsin, Florida, Meromixis, Oxygen, Color, Temperature, Thermocline.
Identifiers: *Anoxic environments, Acetylene reduction assay, Nitrogenases, Nitrogen-15, Nostocales, Lake Mary (Wis), Vilas County (Wis), Lake Mize (Fla), Alachua County (Fla), Monomixis, Heterotrophy, Kjeldahl nitrogen, Biogeochemistry, Organic nitrogen.

Utilizing an assay for nitrogenase activity involving the reduction of acetylene to ethylene, authors studied nitrogen fixation in two dystrophic lakes: Lake Mary, Wisconsin, and Lake Mize, Florida. Following range rates of nitrogen fixation (in nanograms/liter/hour) indicate presence of nitrogenase and in situ fixation in these lakes: Lake Mary (28 June 1968), 3.3-46.6. Lake Mize (11 July 1968), 83-308; 21 August 1968, 0.0-83.3. Maximum fixation occurred in both lakes in aphotic and anoxic environment: at 20 meters in Lake Mary, and in Lake Mize at 9.1 meters in July and at 15 meters in August. Data for total Kjeldahl nitrogen by depth in both lakes (August) and for total organic nitrogen in Lake Mize (July) are also tabulated in report. Authors cite environmental conditions in these lakes as evidence that agents of fixation were probably bacteria rather than cyanophytes. It is suggested that if similar rates of fixation are widespread in anoxic lake water and lacustrine sediments, estimates of the role of fixation in global nitrogen budget will have to be increased. (Eichhorn-Wis)

THE 'WORKING' OF THE MADISON LAKES,
William Trelease.
Wisconsin Acad Sci, Arts and Letters, Vol 7, pp 121-129, 1889. 1 fig, 1 plate, 60 ref.

Descriptors: *Eutrophication, Cyanophyta, Odor, Scum, Fishing, Wisconsin, Bibliographies, Lakes, Nuisance algae, Bacteria, Water pollution effects.
Identifiers: *Madison (Wis), *'Working' of lakes, *Water-bloom, 'Breaking' of lakes, Chroococcaceae, Nostochineae, Clathrocystis aeruginosa, Coelosphaerium Kutzingianum, Anabaena flos aquae, Anabaena mendotae, Anabaena hassali, Lyngbya nollei, Glocotrichia pisum, Nostoc verrucosum, Lake Mendota (Wis), Lake Monona (Wis), Lake Waubesa (Wis), Anabaena circinalis.

The Madison (Wisconsin) lakes were observed for signs of eutrophication from 1882-1887. Symptoms observed included greenish-yellow scum or fine granules suspended in water, odors associated with algal decomposition, staining of shorelines, and decreased fish biting. The algae generally appeared in mid-summer and persisted for only a few days before being broken up and dispersed by breezes. Such phenomena have been referred to as the 'working' or 'breaking' of lakes and are synonymous with the European term 'water-bloom'. The symptons, caused by the occurrence of members of the algae group Cyanophyceae, are favored in stagnant water bodies and usually occur after prolonged hot spells. The two principal subdivisions of the group are Chroococcaceae and Nostochineae. Of the former, Clathrocystis aeruginosa and Coelosphaerium Kutzingianum were the principal problem species in the Madison lakes, and from the latter, Anabaena flos aquae and Anabaena circinalis were most common. Anabaena mendotae, which is more tolerant of cold, predominates late in the season. Paper includes a list of sixty references on water-blooms. Only principal papers treating recurrence of bacteria in quantity are included, most of them have little botanical value but serve as a nucleus for other references available in 1889. (Ketelle-Wis)
W69-08283

HEAT BUDGET OF AN ICE COVERED INLAND LAKE,
Wisconsin Univ., Madison. Dept. of Meteorology.
Jon T. Scott, and Robert A. Ragotzkie.
Technical Report No 6, Series to Lakes and Streams Investigations Committee, Oct 1961. 41 p, 15 fig, 13 tab, 23 ref. ONR Contract No: 1202 (07). NR 387-022.

Descriptors: *Heat budget, *Ice, *Lake, *Conduction, Heat transfer, Latent heat, Heat exchange, Radiation, Albedo, Absorption, Advection, Estimating, Air, Water, Snowcover.
Identifiers: Lake Mendota.

The heat budget for Lake Mendota is evaluated for two winter seasons. Winter is defined as extending from the time just before freezing of the lake surface until all ice has melted in the spring. Change in heat storage, radiation flux, conduction (molecular and/or eddy) and advection are determined separately for snow, ice, and water where applicable. Sensible and latent heat flux at the lake surface are not directly measured, but the heat budget

LIBRARY U. OF I., URBANA-CHAMPAIGN

method appears to be promising for determining at least their sum. Aerial and lake surface measurements of albedo are compared with each other and to visual estimates of albedo based on ice or snow conditions and age of the snow surface. Results indicate that visual estimates by experienced observers are reliable within 10 percent. Heat conduction in the snow-ice-complex is measured using a thermocouple and flux-plate assembly. Seven distinct periods of the winter season are described using the heat budget data for the two years. Net radiation, air temperature, and amount and type of snow cover are the most important factors affecting the heat budget of the winter lake. (Sherman-Vanderbilt)

PRODUCTION OF JUVENILE STEELHEAD TROUT IN A FRESHWATER IMPOUNDMENT,
Oregon State Game Commission, Corvallis. research Div.
Andre G. Coche.
Ecological Monographs, Vol 37, No 3, pp 201-228, Summer 1967. 13 fig, 18 tab, 69 ref, 2 appendices, disc.

Descriptors: *Biomass, *Fish populations, *Growth rates, *Impounded waters, Food habits, Limnology, Mortality, Trout, Oregon.
Identifiers: *Net production, *Salmo gairdneri, *Steelhead trout, *Yield, Aquatic insects, Forage ration, Mortality rates, Littoral fauna, Whistler's Bend Impoundment, Oregon.

The concept of rearing steelhead trout in controlled impoundments has arisen from increasing civilization pressure on areas of natural production. Production of juvenile steelhead trout was studied in relation to temperature and food supply in a 13.3 hectare (ha) impoundment. Over 302 days (by 15-day periods), the stock of 102,000 fish showed instantaneous mortality rates, i, of 0.003-0.117 (total 0.986), total production of 619 killograms (kg) and net production (total minus mortality) of 363 kg (28 kg/ha). Fork length-weight relationship: log W= -2.07+ 3.06 log L; condition factor, K, (with standard errors indicated in parentheses) ranged from 0.89 (0.013) to 1.14 (0.033), remaining greater than 1.0 in summer and less than 1.0 in winter; peak values occurring in August. Instantaneous rate of growth in weight, g, for entire period was 3.6, 88% of this was elaborated in the summer. Trout fed mainly on benthic insects (Chironomidae, Callibaetis, Anisoptera), with crustacean zooplankton being only occasionally important. Changes in growth rate over 15-day periods appeared to be related to feeding habits rather than temperature. Tabular data include population statistics and comparisons of growth rates, production, survival, and yield obtained from several studies. (Voigtlander-Wis)

MORPHOMETRY AS A DOMINANT FACTOR IN THE PRODUCTIVITY OF LARGE LAKES,
Saskatchewan Univ., Saskatoon.
D. S. Rawson.
Verh int Verein theor Limnol, Vol 12, p 164-175, 1955. 5 fig, 3 tab, 15 ref, disc.

Descriptors: *Eutrophication, *Oligotrophy, *Lakes, *Lake morphology, *Productivity, Plankton, Bottom fauna, Fish production, Trophic level, Regression analysis, Estimating equations.
Identifiers: Lake depth, Deep lakes, Shallow lakes, Canada, Lake size.

A quantitative demonstration that deep lakes are usually less productive than shallow ones is provided. Mean depth, regarded as best single index to morphometric conditions, is plotted against dry weight of plankton, bottom fauna and fish production for several lakes in western and central Canada. Analysis of regression were used to produce formulas describing the theoretical relationship between mean depth to the biological parameters. Deviations of the actual amounts of these materials from those expected theoretically appear to be attributable to the modifying effects of climatic or edaphic conditions. (Bortleson-Wis)

STUDIES ON CONNECTICUT LAKE SEDIMENTS. II. CHEMICAL ANALYSES OF A CORE FROM LINSLEY POND, NORTH BRANFORD,
Yale Univ., New Haven, Conn. Osborn Zoological Lab.
G. E. Hutchinson, and Anne Wollack.
Amer J Sci, Vol 238, No 7, p 493-517, July 1940. 4 fig, 3 tab, 21 ref.

Descriptors: *Connecticut, *Chemical analysis, *Lakes, *Sediments, *Eutrophication, Paleolimnology, Sedimentation, Cores, Ecology, Diagenesis, Organic matter, Pollen, Phosphorus, Productivity, Inorganic compounds.
Identifiers: *Linsley Pond (Conn), Lignin, Trophic equilibrium, Glacial history, Paleoecology, North Branford.

Several inorganic and organic constituents were determined on a 43-foot core from Linsley Pond, a small eutrophic lake in Connecticut. The upper 36 feet consisted of a coarse detrital ooze, followed by a transition to a silty clay, which became dominant below 40 feet. The total ash and organic content of the sediments was very uniform throughout the consolidated ooze from 3 to 34 feet. Considerable increase in the inorganic content in the most recent unconsolidated sediment at the top of the profile is taken to indicate increased erosion of cultural origin. The distribution of organic matter in the profile is believed to indicate a rapid change from oligotrophy to eutrophy, followed by a long period of approximate equilibrium in a eutrophic condition. Several measures of organic matter in the sedimentary column were plotted according to two limiting assumptions: (1) that unit thickness of sediment was deposited in unit time, and (2) that unit mass of inorganic sediment was laid down in unit time. The time scale constructed by both methods of analysis revealed an apparent logarithmic increase in organic matter in the region between 43 and 30 feet. It is suggested that the mode of development is characteristic of a growth-curve for organisms. The nature of the trophic equilibrium is examined in relation to nitrogen and phosphorus content of the mud. (Bortleson-Wis)
W69-08521

PALEOLIMNETIC SALINITY OF DZUNGAR AND ORDOS BASINS,
Shao Hung-shuen, and Huang Ti-fan.
Int Geol Rev, Vol 11, No 4, pp 461-470, Apr 1969. 10 p, 2 fig, 4 tab, 8 ref. Transl from Acta Geol Sinica, Vol 45, No 3, pp 337-347, 1965.

Descriptors: *Paleolimnology, *Paleoclimatology, *Lakes, Water quality, Salinity, Paleohydrology, Salts, Evaporation, Water chemistry, Chlorides.
Identifiers: *Paleosalinity, *China, Dzungar, Ordos.

Among geochemical methods available for determination of salinity of paleo water basins, the chlorine-content method, chloro-bromine coefficient method, and salinity coefficient method are considered most effective. The boundary between fresh water and brackish water sediments is marked when the chlorine content of mudstone is 0.02% and the chlorine-bromine coefficient 20 (salinity coefficient being around 1.5); the boundary between brackish and semi-saline sedimentation is recognized when they reach respectively to 0.12-0.15% and 80. Some Dzungar paleo lacustrine basins, during the period from Late Permian to Middle and Early Triassic age had been fille fresh water at the earlier stage, with brackish during the intervening and later stages. salinization cycles show correlation with the tion of the paleo climate. The evolution of sa tent in the paleo lakes of Ordos is quite di from Dzungar lakes. They were of fresh wat ing the Permian and middle Early Triassic, b ing the Early Permian the water was relativel and became somewhat fresh thereafter. Ther together two fresh cycles. The difference in tion of water properties of these 2 lake ba considered to be the logical consequence o respective actual geological environment a confinement of the lake basins. (Knapp-USG

2I. Water in Plants

EFFECTS OF EXTERNAL SALT CONCEN TIONS ON WATER RELATIONS IN PL IV. THE COMPENSATION OF OSMOTIC HYDROSTATIC WATER POTENTIAL FERENCES BETWEEN ROOT XYLEM EXTERNAL MEDIUM,
California Univ., Riverside. Dept. of Soils and Nutrition.
J. J. Oertli, and W. F. Richardson.
Soil Sci, Vol 105, No 3, pp 177-183, 1968. fig, 10 ref.

Descriptors: *Salinity, *Osmotic pressure, *H static pressure, Circulation (Plants), physiology, Transpiration, Moisture u Microenvironment, Soil-water-plant relatio Irrigation effects, Root zone, Zylem.

Experiments on sunflower plants and tomato show that variations of the osmotic potenti ference between root xylem and external m are nearly compensated for by variations hydrostatic potential difference, so that the stays nearly independent of external-solutio centrations having osmotic potentials of 0 bars. Increasing salt concentrations only a this relationship slightly, while reducing tran tion rates substantially. This absence of p tionality between transpiration rate chang change in the net osmotic-hydrostatic potenti ferences is probably the result of a solute ac lation at the root surface and in the root free Other explanations include change of root pe bility for water, due to the salinity, or syste error in experimental procedures. MOISTURE USE BY FORAGE SPECIES AS RELATED TO PAN EVAPORATION AND NET RADIATION,
Agricultural Research Service, Thorsby, Ala. Soil and Water Conservation Research Div.; and Alabama Agricultural Experiment Station, Auburn.
B. D. Doss, O. L. Bennett, and D. A. Ashley.
Soil Science, Vol 98, No 5, p 322-327, 1964. 6 p, 3 fig, 2 tables, 15 ref.

Descriptors: *Water requirements, Moisture use, Evapotranspiration, Soil moisture, Pan evaporation.
Identifiers: *Net radiation, Greenville fine sandy loam.

Moisture-use rates were determined for alfalfa, coastal bermudagrass, and sorghum on Greenville fine sandy loam at Thorsby, Alabama. These rates varied with season of year, available soil moisture, stage of plant growth, and species. Moisture-use rates determined from gravimetric soil sampling throughout the growing season for each species were correlated separately with open pan evaporation and the evapotranspiration equivalent of net radiation. These correlations indicate that either open pan evaporation or net radiation may be used to estimate moisture use of forage crops under conditions where moisture is not limiting provided a relationship has been established for the given species. To estimate moisture use on a daily basis, the appropriate ET/E or ET/Rn ratio is multiplied by the measured daily pan evaporation or the evapotranspiration equivalent of net radiation. (Bennett-USDA Agricultural Research Service)

EFFECT OF PLASTIC MULCH, HERBICIDE, AND TILLAGE ON MOISTURE USE AND YIELD OF CORN,
Agricultural Research Service, Thorsby, Ala. Soil and Water Conservation Research Div.; and Alabama Agricultural Experiment Station, Auburn.
B. D. Doss, O. L. Bennett, and D. A. Ashley.
Journal of Soil and Water Conservation, Vol 21, No 3, p 99-101, May-June, 1966. 3 p, 1 fig, 3 tables, 9 ref.

Descriptors: Moisture use.
Identifiers: *Conventional tillage, *Mulch tillage, Net radiation, Yields.

Corn was grown on a Faceville sandy loam soil to determine the effects of black plastic mulch, herbicide, and tillage on moisture use and yield. Average moisture-use rates were usually low while the plants were small and increased as the amount of vegetative growth increased. Maximum rates were reached during the ear development period. Moisture-use rates during the peak-use period were similar for all treatments, but the plastic mulch reduced moisture use during the early and late parts of the growing season. Plastic mulch over the soil surface increased rate of growth, tillering, lodging, grain yield, and stover production as compared with conventional tillage. Plastic mulch increased grain yields 7 to 14 bushels per acre over conventional tillage, which averaged 80 bushels per acre. Grain yields from the lister planter treatment (mulch-tillage) averaged 83 bushels per acre and were higher than conventional tillage for 2 of the 3 years. Grain yields for the conventional-chemical and small furrow treatments with no cultivation were about the same and averaged 14 bushels per acre lower than yields for conventional tillage. SOIL MOISTURE RESPONSE TO SPRAYING BIG SAGEBRUSH WITH 2, 4-D,
Forest Service (USDA), Laramie, Wyo. Rocky Mountain Forest and Range Experiment Station.
Ronald D. Tabler.
J Range Manage, 1968, 21 (1): 12-15, Illus.

Descriptors: *Sagebrush, *Soil moisture, *Soil-water-plant relationships, *Evapotranspiration, Herbicides, Nuclear moisture meters, Brush control, Range management, *2-4-D.

Studies of soil moisture response to herbicidal control of big sagebrush were initiated one year prior to spraying and were continued for three years after treatment. Spraying big sagebrush with 2,4-D reduced the rate of soil moisture withdrawal. About 75% of the difference in total moisture depletion occurred within the 3- to 6-ft. soil depth; an opposite effect in the second foot indicated that the increase in grass herbage production is most strongly reflected in that zone. Total evapotranspiration losses from the 0- to 6-ft. soil profile were reduced about 14% over the four-month growing period the second year after spraying.

SUMMER WATER USE BY ASPEN, SPRUCE, AND GRASSLAND IN WESTERN COLORADO,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
H. E. Brown, and J. R. Thompson.
J of Forestry 1965, 63 (10): 756-760, illus.

Descriptors: *Consumptive use, *Evapotranspiration, Soil moisture, Soil-water-plant relationships, *Water utilization, Vegetation effects.
Identifiers: *Water use.

Soil moisture was measured in spring and fall of 1955, 1957, and 1958 to determine relative amounts of water use on sites occupied by quaking aspen, Engelmann spruce, and mountain grassland during the summer growing season. Study plots were located on sites where the soil was deep enough to permit gravimeteric sampling to a depth of 8 feet. Water use was considered as the difference between soil moisture in the spring and fall, adjusted for summer precipitation. Aspen plots averaged 19.2 inches, spruce 14.9 inches, and grassland 8.9 inches of water use yearly for the 3 years of record. Because the amount of spring soil moisture was significantly different among types, however, and because spring moisture was correlated with water use in aspen and spruce types, it was impossible to attribute differences in water use solely to the type of vegetation.

SHRUB SEEDLING REGENERATION AFTER CONTROLLED BURNING AND HERBICIDAL TREATMENT OF DENSE PRINGLE MANZANITA CHAPARRAL,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
Charles P. Pase.
USDA Forest Serv Res Note RM-56, illus, 1965. 2 p.

Descriptors: *Ecology, *Succession, *Burning, Brush control, Herbicides, Chaparral, 2-4-D.
Identifiers: *Manzanita, Shrub seedlings, Regeneration.

Planned fall burning of dense manzanita chaparral was followed by large increases in seedlings of yerba-santa, Pringle manzanita, desert ceanothus, and five other brush species. Seedlings of most shrub species were virtually absent from an adjacent unburned area, and from an area sprayed with 2,4-D but not burned.

2J. Erosion and Sedimentation

SAMPLING AND ANALYSIS OF COARSE RIVERBED SEDIMENTS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
T. C. Muir.
Proc Miss State Univ Water Resources Res Inst Conf, State Univ Water Resources Res Inst Conf, State Coll, Apr 8-9, 1969, pp 73-83, 1969. 11 p, 3 fig, 2 tab, 10 ref.

Descriptors: *Sedimentology, *Sampling, *Statistical methods, Sediment transport, Rivers, Streams, Gravels, Sands, Dredging, Particle shape, Particle size.
Identifiers: Areal sampling, Volumetric sampling.

Volumetric, or bulk, sampling of river gravel normally requires considerable effort and equipment and often may not be feasible. Samples may not be representative of the sediment deposit. The depth to which the sample should be taken is usually unknown and affects the shape of the particle size distribution curve. A recommended standard procedure for areal, or surface, sampling is t
tion by the grid method of particles larger t
mm, determination of the arithmetic mean
triaxial dimensions of each particle, and plott
the particle size distribution on a number fre
cy basis. The areal sampling technique can pr
a sample representative of a large area, may b
ried out in shallow water, and all measure
may be completed in the field. Areal sampli
gravel deposits can yield estimates of particle
usually obtained from bulk samples. The proc
may be used in studies of hydraulic roug
channel stability, bed armoring, sediment tra
and in the general classification of river proc
(See W69-08221). (Knapp-USGS)

NEW DATA ON GEOMORPHOLOGY RECENT SEDIMENTS OF THE BERING AND THE GULF OF ALASKA,
All-Union Research Inst. of Marine Fisherie
Oceanography, Moscow (USSR).
D. E. Gershanovich.
Marine Geol, Vol 6, No 4, pp 281-296, Aug
16 p, 9 fig, 7 ref.

Descriptors: *Sedimentation, *Continental
*Continental slope, *Oceans, *Alaska, Sedim
tion rates, Provenance, Geomorphology.
Identifiers: Geosynclines, Bering Sea.

Soviet marine geological surveys in the Beri
and Gulf of Alaska showed considerable
ferences in epicontinental and geosynclinal
mentation. Epicontinental regions of the B
Sea are covered by terrigenous sediments o
ferent granulometry. Diatom sediments priv
the zone of the continental slope and especia
the deep zone of the Bering Sea. They are
more abundant in this area than in the neighb
areas of the north Pacific Ocean. In most
areas of the Komandor-Aleutian island ar
rigenous deposits are prevalent. In the easter
of the Aleutians, both in the Bering Sea and
Pacific Ocean, terrigenous-volcanic and vo
deposits are abundant. In the shelf and conti
slope of the Gulf of Alaska terrigenous and
lesser degree volcanic and foraminiferous
diatomous deposits are found. Near the reg
continental glaciation, glacial-marine and tur
current sediments occur. The rate of the
sedimentation is very high everywhere. It
from 2 to 30 cm/1,000 yr on the shelf of the B
Sea to 40 cm/1,000 yr in the lower inclined p
the continental slope. (Knapp-USGS)

STREAMS IN LARGE ALLUVIAL BED HIGH SLOPE,
Naples Univ. (Italy). Hydraulic Lab.
M. Viparelli, and M. Pica.
Congress held at Ft. Collins, Colo. Proc Int A
Hydraul Res, 12th Congr, Vol 1, A8, pp
1967. 11 p.

Descriptors: *Model studies, *Alluvial cha
*Sediment transport, *Particle size, Flow
Profiles, Streambeds, Hydraulic properties, S
Channels, Sediments.
Identifiers: *Italy, Experimental research.

To find out the fundamentals of fluvial sed
transport in streams in large alluvial beds o
slope, an experimental research project wa
ducted at the Hydraulic Laboratory,
University, Italy. A sandy bottom channel,
wide and 18 m long was employed. Systemati
were made with sands of two textures an
three rates or water flow: 3, 1.5, and 0.75
Other tests were made with channel width re
to 0.30 m. Measured sand discharges and b
profile changes show that the sediments a
local slopes continuously vary around their a
values without apparent cause. Higher
slopes show a linear relation between slop
sand discharges for each sand size and each
flow. For smaller slopes sand discharge dec
slowly with decreasing slope. (Lang-USGS)

EROSIONAL CURRENT MARKS OF WEAKLY COHESIVE MUD BEDS,
Reading Univ. (England). Sedimentology Research Lab.
J. R. L. Allen.
J Sediment Petrol, Vol 39, No 2, pp 607-623, June 1969. 17 p, 18 fig, 1 tab, 28 ref.

Descriptors: *Erosion, *Mud, *Sedimentary structures, *Scour, *Turbulent flow, Regime, Deltas, Sediment-water interfaces, Ripple marks, Streamflow, Stream erosion, Model studies, Hydraulic models, Flow separation.
Identifiers: Flute marks, Weakly cohesive sediments.

The manner in which a bed of weakly cohesive mud is eroded by a plain, turbulent flow of water is found experimentally to depend on the severity of the flow over the bed. The major structures left behind on a weakly cohesive mud bed after a prolonged period of erosion also depend on the severity of flow. With ascending severity, we obtain: (1) longitudinal rectilinear grooves, (2) longitudinal meandering grooves, (3) flute marks, and (4) transverse erosional markings. The more severe flows also give rise to shear wrinkles and to erosional structures of a less well defined nature. Of the 4 structures, all but longitudinal rectilinear grooves have counterparts in the fossil record. Of particular importance is evidence confirming that flute marks are associated with separated flows and are due to processes of flow separation and reattachment. (Knapp-USGS)

THE SEDIMENTOLOGY OF A BRAIDED RIVER,
Ottawa Univ., Ontario. Dept. of Geology.
Peter F. Williams, and Brian R. Rust.
J Sediment Petrol, Vol 39, No 2, pp 649-679, June 1969. 31 p, 28 fig, 5 tab, 22 ref, 2 append.

Descriptors: *Sedimentology, *Rivers, *Braiding, Meanders, Deposition (Sediments), Alluvium, Aggradation, Erosion, Particle size, Particle shape, Discharge (Water), Streamflow, Channel morphology, Clays, Sands, Silts, Gravels, Mud, Regime, Ripple marks, Sedimentary structures, Sand waves.
Identifiers: *Canada, Sedimentary facies, Yukon.

A straight, 4-mile tract of the Donjek River, Yukon, Canada is braided throughout, discharging about 50,000 cfs in flood. The active part of the tract shows upper regime flow in the main channels, and lacks vegetation. Higher, older levels are former river courses, partly or completely vegetated, with continuous flow (principally lower regime) only in the main channels. Comparing channel (width; depth) and topographic indices, the younger surfaces are more strongly dissected because of active channel cutting, whereas channels on older levels are subject to infilling. The sediments vary from clays to coarse gravels; most are poorly sorted. CM plots permit division into 3 main groups: silt and mud of low energy environments such as abandoned channels, gravel of high energy channel-bar complexes, and a variable intermediate group which fills channels under medium-energy conditions. Seven facies are distinguished on textural, floral, and sedimentary structural characteristics. Facies relations are mostly gradational within channels, commonly fining upwards. They are more complex between channels, and invariably erosional. The origin and directional significance of hierarchical orders of sedimentary structures were studied. Six hundred and sixty measurements of small-scale structures (mostly ripples) show moderate within-bar and between-bar variation, and give a grand vector mean 22 deg. from the river trend. Bisectors of channel directional arcs (maximum and average ranges) approximate the river trend within 5 deg. (Knapp-USGS)

PRECIPITATION AND LITHIFICATION OF DEEP-SEA CARBONATES IN THE RED SEA,
Woods Hole Oceanographis Institution, Mass.
John D. Milliman, David A. Ross, and Teh-Lung Ku.
J Sediment Petrol, Vol 39, No 2, pp 724-736, June 1969. 13 p, 14 fig, 2 tab, 41 ref.

Descriptors: *Sedimentation, *Diagenesis, *Water quality, *Water chemistry, Carbonates, Calcite, Sands, Silts, Mud, Deposition (Sediments), Chemical precipitation, Sea water, Evaporation, Salinity, Trace elements.
Identifiers: *Red Sea, Aragonite.

More than one-half of the deep-sea carbonates in the Red Sea are estimated to have been inorganically precipitated. Aragonite-cemented layers were formed during glacially lowered stands of sea level, when Red Sea waters were highly saline. Some magnesian calcite lithic fragments might represent inverstion products of aragonite; others are believed to have been precipitated directly from normal Red Sea water. Chemical mineralogical and petrographic similarities with lithic fragments suggest that the magnesian calcite portion of the Red Sea lutite was also inorganically precipitated. Similar inorganic carbonate precipitation probably occurred in the Mediterranean Sea, during glacially lowered sea level. (Knapp-USGS)

A NOTE ON THE RELATIONSHIP OF GRAIN SIZE, CLAY CONTENT, QUARTZ AND ORGANIC CARBON IN SOME LAKE ERIE AND LAKE ONTARIO SEDIMENTS,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Centre for Inland Waters.
R. L. Thomas.
J Sediment Petrol, Vol 39, No 2, pp 803-809, June 1969. 7 p, 5 fig, 2 tab, 14 ref.

Descriptors: *Sediments, *Lake Erie, *Lake Ontario, *Organic matter, Clays, Sands, Silts, Carbon, Organic compounds, Great Lakes, Deposition (Sediments), Quartz, Sedimentation, Particle shape, Particle size.
Identifiers: Great Lakes sediments.

An examination of the geochemistry of fine-grained sediments in relation to size frequency distribution was carried out on sediment samples from Lakes Erie and Ontario. This study demonstrated a direct relationship between the under 2 micron grain size and the theoretical clay content computed from the organic carbon, quartz and carbonate content. A sympathetic relationship was observed between clay content and organic carbon, and also between median grain size and quartz content. The former relationship is believed to be the result of absorption from solution and the latter is brought about by natural sedimentation from suspension. (Knapp-USGS)
W69-08586

DISPERSION OF SILT PARTICLES IN OPEN CHANNEL FLOW,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
William W. Sayre.
ASCE Proc, J Hydraul Div, Vol 94, No HY3, Pap 6579, pp 1009-1038, May 1969. 30 p, 13 fig, 2 tab, 15 ref, append.

Descriptors: *Sediment transport, *Suspended load, *Model studies, *Mathematical models, *Dispersion, Digital computers, Hydraulic models, Tracers, Diffusion, Turbulent flow, Open-channel flow, Sediment transport, Silts, Equations.
Identifiers: Shear flow, Silt suspensions.

The dispersion process for sediment particles in a 2-dimensional turbulent shear flow is formulated in 2 differential equations, 1 for particles suspended in the flow and the other for those deposited on the bed. Exchange of particles between the bed and the flow is permitted. Using the Aris moment transformations, the equations are converted to a more tractable system of equations which are solved by numerical methods with the aid of a digital computer, for the zero, first, second and third moments of the longitudinal concentration distributions. Various combinations of boundary and other input conditions are imposed and their effects on the dispersion process are demonstrated. The results of the numerical solutions together with the results of earlier dispersion experiments with silt particles and fluorescent dyes show that the tendency of the silt particles toward deposition and temporary storage on the bed can profoundly affect the longitudinal dispersion process. (Knapp-USGS)
W69-08592

ELECTRON MICROSCOPY OF CHEMICAL SOLUTION AND MECHANICAL ABRASION FEATURES ON QUARTZ SAND GRAINS,
Florida State Univ., Tallahassee. Dept. of Geology.
Stanley V. Margolis.
Sediment Geol, Vol 2, No 4, p 243-256, Dec 1968. 14 p, 13 fig, 1 tab, 18 ref.

Descriptors: *Beaches, *Sands, *Abrasion, *Pitting (Corrosion), *Quartz, Waves (Water), Weathering, Corrosion, Electron microscopy, Chemical properties.
Identifiers: Quartz grain etching.

Crystallographically oriented etch pits have been observed on quartz sand grains from marine environments, using an electron microscope. Similar features have been produced by etching quartz in the laboratory with hydrofluoric acid and sodium hydroxide. Examination of quartz sand grain surfaces from beaches of different wave intensities along the Atlantic and Gulf coasts of the United States suggests a relationship between the effects of such chemical solution features and mechanical abrasion on sand grains. Sand grains from beaches with low wave activity exhibit oriented etch pits readily attributed to the solution of quartz by sea water. These features are the surface expression of defects within the crystal. Sand grains from beaches with moderate wave energy show a combination of chemical etch features and those phenomena thought to be caused by grain-to-grain impacts, while grains from high-energy beaches predominantly show impact features. If the correlations shown by the results are valid, the relative number of chemical and mechanical features on sand grains can be used to determine energy conditions along ancient shorelines. (Knapp-USGS)

'PEBBLE CLUSTERS': THEIR ORIGIN AND UTILIZATION IN THE STUDY OF PALAEOCURRENTS,
Ferrara Univ. (Italy). Inst of Geology.
Renzo Dal Cin.
Sediment Geol, Vol 2, No 4 p 233-241, Dec 1968. 9 p, 5 fig, 12 ref.

Descriptors: *Sediment distribution, *Bed load, *Gravels, *Paleohydrology, *Sediment transport, Sedimentation, Sediment load, Running waters, Distribution patterns, Deposition (Sediments), Sedimentary structures.
Identifiers: *Pebble clusters, *Paleocurrent indicators.

'Pebble clusters' are characteristic of some coarse, poorly-sorted fluvial deposits; they form when pebbles in the course of transport are stopped by cobbles or boulders protruding from the river bed. In this way wake-like piles of coarse particles accumulate in front of the obstacle which stopped them. 'Pebble clusters' offer excellent indications of the direction of the current, because they are always parallel, or nearly so, to the direction of the current and because the wake is almost always upstream and the boulder downstream. Furthermore, their presence in conglomerates of unknown origin offers evidence of unidirectional transport and excludes beach deposits. Finally, 'pebble clusters' are also a clue to the mode of deposition of the cles; clusters require selective transport rathe mass transport. (Knapp-USGS)

DESCRIPTION OF THE HYDROLOGIC REGIME OFF THE GRAIN AND IVORY COASTS BETWEEN ABIDJAN AND MONROVIA (FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Paris (France).
J. R. Donguy, and M. Prive.
Cah O.R.S.T.O.M., Ser Oceangr, Vol 6, No 2, pp 47-51, 1968. 5 p, 14 fig, 18 ref.

Descriptors: *Hydrologic properties, *Coasts, *Estuarine environment, Dynamics, Salinity, Seasonal, Sea water Thermocline, Isotherms, Temperature, Topography, Pressure, Winds, Mapping, Currents (Water).
Identifiers: *Africa, Ivory Coast, Grain Coast.

The coastal water hydrologic regime between Abidjan and Monrovia, Africa, is described. Data were collected by the R/V 'Reine Pokou' of the Center of Oceanographic Research off the Ivory Coast during 1964 expedition. The article contains maps of salinity, surface water temperature, isotherms, thermoclines, and surface topographic dynamics. Far away from the coastal strip, the hydrographic conditions are identical with those of the South Atlantic. Some dissimilarity was found between the seasons of the Ivory Coast and the Grain Coast. ESTUARIAL SYSTEMS ANALYSIS QUANTITY AND QUALITY CONSIDERATIONS,
Water Resources Engineers, Inc., Walnut Creek, Calif.
Gerald T. Orlob.
Proc, Nat Symp Anal Water Resource Syst, pp 341-358, Denver, July 1968. 18 p, 9 fig.

Descriptors: *Estuarine environment, *Networks, *Hydrodynamics, *Systems analysis, *Quality control, Mathematical models, Hydrologic properties, Advection, Diffusion, Water resources, Time, Discharge (Water).
Identifiers: *San Francisco Bay-Delta System, Australia.

A technique for representing the complex hydrodynamic behavior of estuarial environments through a mathematical model comprised of a network of one dimensional channel elements was described. The equations of motion for each element and of continuity for each node in the network were solved over a time continuum to produce a dynamic response to tides and hydrologic flumes imposed at the boundaries of the model. Histories of discharge, velocity, area and tidal elevations were generated for each element or node in the system and supplied as input information to a compatible water quality model. Quality behavior was simulated by satisfying mass balance equations for conservative and nonconservative substances at nodes and by transporting materials between nodes according to advective and diffusional properties of the system. Examples of model application were given for the San Francisco Bay-Delta System and two estuaries in Australia. Suggestions were made for future research on estuarial hydrodynamics and water quality and for the application of systems analysis as a tool in water resource management. (Thiuri-Cornell)

Identifiers: Key West (Fla).

Bluefish Channel, north of Key West, Florida, is a prominent ebb channel incised into a thick Recent carbonate bank that overlies Pleistocene limestone. The dominant sediments are Halimeda, foraminifera, molluscs, and fragments derived from the Pleistocene bedrock. Because the source area is the entire course of the channel, sediment mixing results in textural inversions (abnormal size-to-roundness relations) and characteristically negatively-skewed channel sands. A plot of sorting vs grain size of sediments of energy-levels reveals a sinusoidal trend similar to that of beach sediments. With increased sorting and abrasion, the constituents tend to be distributed proportionally in the sediment. The best sorted sediment is mature medium calcarenite, a mixture of 4 constituents in almost equal proportions. Some calcarenites deposited at the tidal delta show the initial stages of cementation by chemically precipitated aragonite crystals. Hydrodynamically, the channel is characterized by the upper-flow regime. The most conspicuous bed forms are straight-crested magaripples at the channel mouth and adjacent parts of the rapidly growing tidal delta. Here beds of cohesive carbonate muds are exposed to submarine erosion, producing armored mud balls and intraformational flat-pebble conglomerates, identical with some of those interpreted as a product of supratidal environment. THE SIGNIFICANCE AND LIMITATIONS OF STATISTICAL PARAMETERS FOR DISTINGUISHING ANCIENT AND MODERN SEDIMENTARY ENVIRONMENTS OF THE LOWER GEORGIA COASTAL PLAIN,
Goldsmiths' Coll., London (England). Dept. of Geology and Geography; and Georgia Univ., Sapelo Island. Marine Inst.
John R. Hails, and John H. Hoyt.
J Sediment Petrol, Vol 39, No 2, pp 559-580, June 1969. 22 p, 10 fig, 5 tab, 22 ref. Grants NSF-GP 1380 and NSF-GA 704.

Descriptors: *Sedimentation, *Particle size, *Statistical methods, Coasts, Estuaries, Tidal marshes, Beaches, Sands, Sand bars, Currents (Water), Waves (Water), Paleohydrology, Deposition (Sediments), Erosion, Sediment transport.
Identifiers: Georgia Coastal Plain.

The lower Coastal Plain of Georgia is a significant area for the study of preserved coastline sediments because ancient deposits are generally well preserved. Samples were collected from 6 Pleistocene barrier coastlines and the Holocene coast to evaluate the statistical parameters for distinguishing ancient and modern sedimentary environments. The sediments of each barrier coastline can be subdivided into lagoon-salt marsh and barrier-island facies. The lagoon-salt marsh facies includes estuarine and tidal channel sediments, and the barrier facies includes dune, littoral, shallow neritic and offshore channel deposits. Barrier

LIBRARY U. OF I., URBANA-CHAMPAIGN

island sands are better sorted than those from lagoon-salt marsh environments although all samples have mean grain size values higher than 1.50 phi. The coarsest sediments in the barrier island environments are found in the tidal inlets and channels, and about 70% of the samples are negatively skewed. About 30% of the lagoon-salt marsh sands are positively skewed. More than 90% of the Holocene beach sands are negatively skewed, but about 70% of the dune sands show positive skewness. The sign of skewness in this study is related to energy variations in different sedimentary environments. (Knapp-USGS)

OBSERVATIONS OF MOTION AT INTERMEDIATE AND LARGE SCALES IN A COASTAL PLAIN ESTUARY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Glenn A. Cannon.
Chesapeake-Bay Inst Tech Rep No 52, Mar 1969. 116 p, 26 fig, 13 tab, 25 ref. Contract No. Nonr 4010 (11) ONR. Proj No NR 083-016 ONR.

Descriptors: *Currents (Water), *Estuaries, Current meters, Streamflow, Velocity, Tides, Seiches, Regression analysis, Turbulence, Water circulation, Waves (Water).
Identifiers: *Chesapeake Bay, Kinetic energy density spectra, Patuxent estuary.

Observations of motion at intermediate and large scales were made in a coastal plain estuary using current meters consisting of 2 propellers rigidly attached to a bottom mounted tower, oriented at right angles to each other to measure the horizontal velocity vector. At large scales the results indicated that estimates of river flow from observations of current velocity and salinity can be difficult and that bottom friction may have more effect on tidal currents in the estuary than was previously known. Spectra of kinetic-energy density at intermediate frequencies were similar in one run over horizontal distances of 500 m, and they could be satisfactorily represented in 2 frequency bands by straight lines (on log-log plots) with a -5/3 slope. Between the 2 regions with -5/3 slopes, there was an increase in the energy level in both velocity components by a factor of about 2. The natural period for cross-channel seiching occurred in the same interval. Spectra from the other 2 runs showed significant time changes. Estimates of coherence at intermediate frequencies using record lengths of several tidal cycles appeared to be unreliable, and the phases appeared to vary randomly as a function of frequency. DESALINATION-POWER PLANT PROVES ECONOMICALLY FEASIBLE,
Kaiser Engineers, Oakland, Calif.
P. D. Bush, J. Finke, and J. R. Wilson.
Environmental Science and Technology, Vol 2, No 6, pp 428-434, June, 1968. 6 p, 4 fig.

Descriptors: *Variable costs, *Desalination plants, *Electric power production, Alternative costs, Annual costs, Capital costs, Unit costs, Economic feasibility, Electric power rates, Initial costs, Maintenance cost, Operating costs.
Identifiers: *Desalination-power plant, Israel.

This paper reports on an engineering feasibility and economic study of a dual-purpose power generation and desalinization plant to be located in Israel. The proposed plant (100 m.g.d.) was 40 times larger than any operating at that time. Estimated unit water cost studies were followed by studies of capital cost variants and annual cost variants in an effort to evaluate their effect on unit water cost. These studies show that the variables can only affect unit cost of water from dual-purpose plants by 15%, from best to worst conditions. Also revealed is that the desalting plant design which is optimum for one fixed charge rate may be used for other fixed charge rates with essentially no economic penalty. (Sherbrooke-Ariz)

REVERSE OSMOSIS MEMBRANE REGENERATION,
American Standard Inc., New Brunswick, N. J.
E. A. G. Hamer, and R. L. Kalish.
OSW R and D Report No 471, OSW 14-01-0001-1171, 1969. 80 p.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, Regeneration.
Identifiers: *Membrane compaction, Flux restoration, Membrane cleaning.

Laboratory investigations were carried out to determine the feasibility of (1) removing scale from cellulose acetate membranes that had been used for reverse osmosis demineralization, and (2) restoring the performance of compacted membranes by subjecting them to various regeneration treatments. Sodium hydrosulfite solutions and oxalic acid solutions at concentrations of 1-5 percent and 0.2 percent, respectively, were effective in cleaning the membrane without degrading it, but there was little subsequent improvement in membrane performance. On the other hand, membranes that had been subjected to accelerated compaction at 1,500 psi were effectively regenerated by simple soaking in hot water at temperatures approaching the values originally used in their production. Flux recoveries up to 60 percent were achieved with no net loss in salt rejection. (Mintz-Office of Saline Water)

MATHEMATICAL MODEL AND COMPUTER PROGRAM FOR SIMULATION AND OPTIMUM DESIGN OF VERTICAL TUBE EVAPORATION PLANTS FOR SALINE WATER CONVERSION,
Houston Research Inst., Inc., Tex.
C. J. Huang, H. M. Lee, and A. E. Duckler.
Int J Sci Technol Water Desalting, Vol 6, No 1, p 25-56, Apr 1, 1969. 32 p, 12 tab, 13 fig, 9 ref.

Descriptors: *Mathematical models, *Dynamic programming, *Simulation analysis, *Optimization, *Desalination, Evaporation, Design, Saline water, Capital, Evaporators, Size.
Identifiers: Module approach, Vertical tube evaporation, Gradient techniques.

The techniques of obtaining optimum design for a desalting plant were presented. The objective of the study was to develop a computer program for simulating and designing a multistage vertical tube evaporation falling film desalination plant, which could be constructed with a minimum capital investment, or which produced fresh water at the lowest cost possible. The 'module approach' was adopted for developing the complete system that was divided into four major subsystems. Dynamic programming was applied to optimize simultaneously tube size distribution and recirculation rate. The gradient searching technique was found to be most suitable for optimizing a continuous process. As an example, the application of the model, an optimum design of a saline water conversion plant with product rate of 50 million gallons fresh water per day was presented. It was demonstrated that for a specified production capacity an optimum design of a desalting plant can be directly and automatically generated by the programmed model and that the simulation and optimization system developed was reasonably general, versatile and flexible. 3B. Water Yield Improvement

WATER YIELD CHANGES AFTER CONVERTING A FORESTED CATCHMENT TO GRASS,
Forest Service (USDA), Tempe, Ariz. Forest Hydrology Lab.
A. R. Hibbert.
Water Resources Res, Vol 5, No 3, pp 634-64[illegible] June 1969. 7 p, 3 fig, 13 ref.

Descriptors: *Water yield improvement, *Clear cutting, *Evapotranspiration control, Evapotranspiration, Infiltration, Rainfall-runoff relationship, Forest management, Watershed management, Water management (Applied), Water harvesting.
Identifiers: Grassed watersheds.

A 22-acre catchment in the southern Appalachians was cleared of hardwood forest in 1958 and 195[illegible] and seeded to Kentucky 31 fescue grass in 195[illegible] and 1960. The amount of evapotranspiration by the grass cover was closely related to the amount of grass produced. During years when grass production was high, water yield from the catchment was about the same as or less than the expected yield from the original forest. As grass productivity declined, water yield gradually increased until it exceeded the predicted yield from the forest by over 5 inches annually. The grass appeared to evaporate more water early in the spring and less water late in the summer than the original forest cover. (Knapp-USGS)

y, Economic justification, Project planning, nomic feasibility, Evaluation, Economics, Pro- benefits, Snowpacks.
tifiers: *Snow fences.

w fencing promises to be an important means of easing surface water yield or ground water arge on windswept watersheds where snow is mportant form of precipitation. Assuming an ılly spaced series of snow fences, a physical luction function can be developed that relates e spacing to the 'most probable' annual snow h, based on a probability analysis of winter ipitation. The optimum scale of development rms of fence spacing, determined by standard ginal analysis, indicates that the smaller the ginal value of output with respect to inputs, the ter the probability must be of the fences filling ıally if net benefits are to be maximized.

ntifiers: *Moist site timber, Perennial grass, Ex- imental watersheds.

Workman Creek experimental watersheds lie ıin the humid forest type of central Arizona ut 50 miles north of Globe, Arizona. Of the e watersheds available, one is reserved as a trol to determine treatment effects on the other . The North Fork watershed is used to evaluate nges in water yield and sedimentation resulting n removing or changing cover types. The first treatment was a riparian cut to remove broadleaf trees along the stream channel. The second step was a moist site cut to remove and replace with perennial grass all trees growing on moist bottom sites. The riparian cut had no effect on streamflow, the moist cut after two years indicated nonsignificance for a year of below average streamflow and significance for a year of above average streamflow. South Fork is being managed for production of high quality timber and its effect on water and sediment yields. The first cut removed about 50% of the merchantable volume and was followed by an improvement cut. This timber harvest cut did not affect water yields.

WATER YIELDS RESULTING FROM TREATMENTS APPLIED TO MIXED CONIFER WATERSHED,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
Lowell R. Rich.
Arizona Watershed Symposium Proc (9) 1965, 12-15, illus.

Descriptors: *Water, *Mixed forests, *Regression analysis, Watershed management, *Water yield improvement, Coniferous forests.
Identifiers: *Riparian cut, *Moist site forest vegetation, Wildland watersheds, Management practices, Timber harvest, Experimental watersheds, Perennial grasses.

Removal of moist site forest vegetation along main stream channels and replacement with perennial grass have resulted in significant water yield increases. The adjusted increase would be 1.1 inches+ 0.3 inch at the 95 percent level: this increase averages 46 percent. A commercial timber harvest on an individual tree selection harvest did not significantly increase water yields. One problem for the future is to find a method of timber harvest that will increase water yields and produce a favorable tree cover for needed uses.

PRELIMINARY EFFECTS OF FOREST TREE REMOVAL ON WATER YIELDS AND SEDIMENTATION,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
L. R. Rich.
Arizona Watershed Sympos Proc (4) 1960, 13-16, illus.

Descriptors: *Demonstration watersheds, *Humid areas, *Streamflow, Sandstones, Loam, Clay loam, Clays, Mixed forests, Riparian plants, Precipitation, Sediments, Coniferous forests, Water yield improvment, sediment yield.
Identifiers: Quartizite, Diabase, Perennial grasses, Experimental watersheds.

Two management treatments are reported for the Workman Creek, Arizona watersheds. Elevations vary from 6,590 to 7,724 feet. Precipitation averages about 32 inches and streamflow about 3 1/2 inches. Mixed conifer vegetation dominates the area. A riparian cut (Arizona alder and big tooth maple) that removed 0.6 percent of trees on the 248 acre North Fork Watershed showed no significant increase in water yields. Following replacement of 80 acres of moist site (white and Douglas-fir) vegetation with perennial grass, the first two years of measured streamflow indicate one year of nonsignificance and one year of significantly increased water yield. Sediment yields increased during the first two years. This replacement treatment cost $379.00 per acre for clearing, windowing, slash burning, seeding, and initial suppression of sprouts.

IMPROVING WATER YIELD AND GAME HABITAT BY CHEMICAL CONTROL OF CHAPARRAL,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
C. P. Pase, P. A. Ingebo, E. A. Davis, and C. Y. McCulloch.
Proc Int Union Forestry Res Organ XIV: 463-486. 1967.

Descriptors: *Water yield improvement, *Brush control, *Herbicides, *Deer, Chaparral, Wildlife habitats, Watershed management, Erosion, 2, 4, 5-T.
Identifiers: *Fenuron, *Picloram, Post-fire erosion.

Aerial and hand application of 2,4,5-T for 4 consecutive years held crown cover of chaparral fire sprouts to 12 percent, compared to 56 percent on unsuppressed fire sprouts. Water yield increases on a 38.6 ha. watershed averaged 76 mm. per year for the first 3 years. With high rainfall the fourth year, the increase was 250 mm. Chemical control resulted in higher forb and grass production and more deer use than on an adjacent untreated watershed. Hand application of fenuron or picloram to 6-year-old fire sprouts on northerly aspects and channel bottoms on a 18.8 ha. watershed reduced crown cover from 51 percent to 12 percent on the treated area. Water yield appears to be increasing, but data insufficient to draw firm conclusions. Shrub control on cool, more moist sites with interspersed escape cover on southerly aspects might favor deer habitat.
W69-08483

BURNED CHAPARRAL TO GRASS: EARLY EFFECTS ON WATER AND SEDIMENT YIELDS FROM TWO GRANITIC SOIL WATERSHEDS IN ARIZONA,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
Charles P. Pase, and P. A. Ingebo.
Ariz Watershed Symp Proc 9: 8-11, illus. 1965.

Descriptors: *Chaparral, *Brush control, *Water yield improvement, Accelerated erosion, Vegetation effects, Watershed management, Shrubs, Herbicides, Burning, Vegetation regrowth, 2-4-55-T.
Identifiers: *Post-fire erosion, Live oak, Experimental watersheds.

Annual spraying with 2,4,5-T following a wildfire in chaparral successfully held resprouting brush cover to less than 10 percent crown density and allowed establishment of a good grass cover. Compared to an adjacent watershed returning to brush cover, water yields increased significantly. Sediment yields increased immediately after the fire, and declined to near prefire levels within 5 years.
W69-08485

HELICOPTER-APPLIED HERBICIDES CONTROL SHRUB LIVE OAK AND BIRCHLEAF MOUNTAINMAHOGANY,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
C. P. Pase.
US Forest Serv Res Note RM-84. 4 p, illus. 1967.

Descriptors: *Brush control, *Herbicides, Chaparral, *2-4-5-T, Shrubs, 2-4-D.
Identifiers: Helicopter, Aerial spray, Live oak, Mountainmahogany.

Four annual helicopter applications of 2,4,5-T to fire sprouts of chaparral held shrub live oak and birchleaf mountainmahogany cover to less than 5 percent, while unsprayed sprouts increased to 21 percent. No difference was found between emulsifiable and invert forms of 2,4,5-T, and 1:1 mixtures of oil soluble 2,4,5-T and 2,4-D. PBA and TBA were substantially less effective in retarding shrub growth.

LIBRARY U. OF I., URBANA-CHAMPAIGN

PERPETUAL SUCCESSION OF STREAM-CHANNEL VEGETATION IN A SEMIARID REGION,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
C. J. Campbell, and Win Green.
J Ariz Acad Sci Vol 5, No 2, p 86-98, Oct 1968.

Descriptors: *Riparian plants, *Succession, Distribution patterns, Ecology, Cottonwoods, Mesquite, Riparian water loss, Vegetation, Elevation.
Identifiers: *Riparian hardwoods, Sycamore.

The community aspects of channel vegetation with respect to changing elevation on Sycamore Creek, Maricopa County, Arizona were studied by means of 402 stratified random, 0.05-acre quadrats to determine shrub and tree composition, and 150 permanently located 9.6-square-foot quadrates to determine grass and forb composition. Ninety-five percent of the shrub species sampled and approximately 50 percent of the tree species are indigenous to the semiarid mountain slopes, and are not dependent upon additional subsurface moisture in the channel for survival. The true riparian species exist only where additional subsurface moisture is available in addition to annual precipitation. Riparian species are found along the stream channel in a relatively narrow band that sometimes bisects sharply demarked vegetational zones. The channel vegetation probably never reaches a climax hierarchy due to periodic flood disturbances such as erosion, inundation, and deposition. As a result, mosaics of various seral stages with different dominant species characterize the vegetation communities.

GUIDE FOR SURVEYING PHREATOPHYTE VEGETATION,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
J. S. Horton, T. W. Robinson, and H. R. McDonald.
For sale by Sub Dec USGPO for 20 cents. U S Dep Agr, Agr Handbook, No 266, May 64. 37 p, illus.

Descriptors: *Vegetation, Surveys, *Aerial photography, *Phreatophytes, *Statistical methods, Tamarisk, Riparian plants, Playas, Flood plains, Water loss, Riparian water loss, Evapotranspiration, Vegetation effects.
Identifiers: Vegetation surveys.

In the arid and semiarid region of the western United States, water losses from stream channels, flood plains, bottom lands, and delta areas by evapotranspiration are serious. In spite of water losses and creation of additional flood hazards, vegetation growing along streams or on flood plains may have considerable economic value for recreational use, grazing, wildlife, or flood control. To properly manage bottom-land and streambank areas and to evaluate the overall effects of vegetation treatments, surveys are needed to determine the kinds of plants present in the existing stands, the relative importance of component species, and such characteristics of the vegetation as percentage of the ground covered by living plants, average height and crown thickness of the trees and shrubs, and the amount of understory vegetation. An economic sampling scheme that can be repeated and will yield data precise enough to be reliable is described.

OBSERVATIONS OF SNOWPACK ACCUMULATION, MELT, AND RUNOFF ON A SMALL ARIZONA WATERSHED,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
Peter F. Ffolliott, and Edward A. Hansen.
USDA Forest Serv Res Note RM-124, 1968. 7 p.

Descriptors: *Snowpacks, *Runoff, *Snowmelt, Streamflow, Overland flow, Elevation, Coniferous forests, *Water field improvement, Ponderosa pine trees, Forest management, *Watershed management.
Identifiers: *Experimental watersheds.

Intensive measurements of snow and streamflow on a 425-acre ponderosa pine watershed indicated that more than 90 percent of the snowpack left the watershed as runoff. Snow accumulation was inversely related to forest density, which indicates a possible opportunity for increasing snow accumulation through more intensive forest management.
W69-08493

OBSERVATIONS OF SNOW ACCUMULATION AND MELT IN DEMONSTRATION CUTTINGS OF PONDEROSA PINE IN CENTRAL ARIZONA,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
Edward A. Hansen, and Peter F. Ffolliott.
USDA Forest Serv Res Note RM-111, 1968. 12 p.

Descriptors: *Snowmelt, *Snowpacks, Coniferous forests, *Water yield improvement, Timing, Snow cover, Ponderosa pine trees, *Watershed management, Forest management, Clear-cutting, Water loss.
Identifiers: *Experimental watersheds.

A clearcut block on a north aspect and strips with widths of one and one-and-one-half times tree height on an east aspect increased snow accumulation and increased rates of melt and daily water loss. A strip three-fourths as wide as tree height on a west aspect increased snow accumulation. None of the strips cut on south and southwest aspects affected snowpacks measurably.
W69-08494

POSSIBILITIES OF INCREASING STREAMFLOW FROM FOREST AND RANGE WATERSHEDS BY MANIPULATING THE VEGETATIVE COVER--THE BEAVER CREEK PILOT WATERSHED EVALUATION STUDY,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
Raymond Price.
Inter Union Forest Res Organ XIV. IUFRO-Kongress, VI, Sect 01-02-11, 1967. p. 487-504.

Descriptors: *Water field improvement, *Vegetation effects, *Watershed management, Runoff, Forest management, Coniferous forests, Ponderosa pine trees, Pinyon pine trees, Soil-water-plant relationships.
Identifiers: *Experimental watersheds, Pinyon-juniper.

Increasing population, agricultural activity, and industrial development call for increased water supplies in many parts of the world. One possibility of increasing streamflow is through manipulating vegetative cover on watersheds. The Beaver Creek pilot watershed in north-central Arizona has been designed to evaluate possibilities of incre
water yields by modifying vegetative cover. Ev
tions are made in terms of other multiple-use
products as well as water and also in econ
terms. Studies are underway to lower pinyo
niper woodland, upper pinyon juniper wood
and ponderosa pine forest types. Precipitatio
ries from 13 to 25 inches in the lower woo
type, from 14 to 30 inches in the upper woo
type, and from 15 to 43 inches in the pine
type. Eighteen small watersheds have
delineated and instrumented. Each has been
toried with respect to soil, timber, forage, an
dlife habitat as well as streamflow. First treat
tested have been drastic measures such as com
removal of trees. Subsequent treatments ar
severe. This project involves original wo
design, instrumentation, and other methodolo
is closely coordinated with economics rese
and economic principles are considered in
ning studies and results of treatments ca
analyzed in economic terms. (Lloyd-USDA
Service)

Water yield improvement.
Identifiers: Hydrologic potential, Forest pa
Timber harvest, Type conversion.

Snowpacks are managed by controlling snow
mulation, snowmelt, and evaporation; the
melt water is further managed by con
vegetation-induced losses--interception anc
piration--by controlling evaporation from s
water surfaces, by modifying the retention
teristics of the soil 'reservoir,' and by modify
surface and subsurface paths that the water
its runoff. This paper summarizes some
present techniques and what they can acco
and points out how water management can
place in basin management. The role of cu
forest, brushland conversion, and artifici
barriers in management for water supply a
trol is illustrated with results from Colora

lifornia. Tentative criteria are suggested for sign of forest cuttings for particular objectives of ter yield improvement, flood prevention, and iment control. Further studies are suggested, h of physical applications to forest sites and of praisals methods which will allow the integration physical knowledge in the design of systems of in management.

ROUND WATER OF THE WESTERN DESERT N IRAQ,
aghdad Univ. (Iraq). Dept. of Geology.
bbas Ihsan Baghdadi.
ternat'l Assoc Hydrogeol, Congress of Istanbul, 967, Memoir 8, pp 525-532, 1968. 8 p, 4 pl, 3 ref.

escriptors: *Aquifer characteristics, Arid lands, rid climate, Depression storage, Drainage patrns (Geologic), Geomorphology, Playas, Topogphy, Valleys, Limestones, Deep wells, Fractures (Geologic), Geohydrologic units, Groundwater basins, Shallow wells, Springs, Watertable, Saline water, Hardness (Water), Alkalinity, Nitrates, Sulfates, Chlorides, Carbonates.
Identifiers: *Western Desert, *Iraq.

The little varied topography and dominate geologic features of the Western Desert of Iraq are described under 5 geographical subdivisions; Al Hamad Plain, Upper Wadian, Al Hajara Plain, Lower Wadian and Dibdibba Plain. In the south the watertable is present at a shallow depth, but in the north it is at relatively deep levels. Generally the shallow wells obtain water from valley gravels and sands, while deep wells depend on fractured limestone and porous limestone. Drilled or hand dug wells are located in playas, depressions and valley beds. Low rainfall accompanied by high evaporation result in almost no recharge, an important factor in considering exploitation of groundwater resources of this area. The geographic occurrence of 5 types of water are noted; sulphate predominant mixed saline, chloride predominant mixed saline, nitrate, carbonate and alkaline. Water in valley gravels and sands is medium hard, while that in fractured limestone is very hard. Yield, chemistry and temperature are noted for springs. (Sherbrooke-Ariz)

SEASONAL VARIATION IN ALKALINITY IN PANS IN CENTRAL AFRICA,
Leicester Univ. (England). Dept. of Zoology.
J. S. Weir.
Hydro-Biologic, Vol 32, No 1/2, pp 69-80, 1968. 12 p, 8 fig, 11 ref.

Descriptors: *Alkalinity, *Seasonal, Ions, Groundwater, Hydrogenion concentration, Bicarbonates, Hardness (Water), Water analysis, Aeolian soils, Sands, Game management, Dry seasons, Annual, Wet seasons.
Identifiers: *Pans, *Central Africa, Rhodesia, Kalahari sand deposits, Wankie National Park.

This paper considers seasonal variation of pH and alkalinity of 65 pans in semi-arid Central Africa. Several types of pans were considered: natural semi-permanent or occasionally permanent, semipermanent showing human influence, deepened permanent, and pumped permanent. pH of natural pans ranged from 6.1 to 8.7 and total alkalinity from 10 mg/1. to 580 mg/1. Variation was attributed to local soil differences. Natural pans reached their maximal size in Jan. or Feb., the rainy season, and showed maximal alkalinity and pH in Aug./Sept. (no rain since April) or in Nov. after the first rains partially filled the pans. Seasonal variation of alkalinity and pH in semi-permanent human influenced and deepened permanent pans followed the pattern of natural pans. 'Pumped' pans were all alkaline with large values of total alkalinity. This was attributed to the nature of the borehole water pumped and period of pumping. There is no correlation between variations in the numbers of game animals recorded at pans with differences in bicarbonate alkalinity. Fish, turtles or insects living either in permanent or temporary pans have to withstand a wide range of alkalinity fluctuation during the year. (Sherbrooke-Ariz)

STOMATAL INFILTRATION MEASUREMENTS AS AN INDICATOR OF THE WATER REQUIREMENT AND TIMING OF IRRIGATION FOR COTTON,
National and Univ. Inst. of Agriculture, Rehovoth (Israel).
M. Ofir, E. Shmueli, and S. Moreshet.
Expl Agric, Vol 4, pp 325-333, 1968. 9 p, 8 fig, 11 ref.

Descriptors: *Stomata, *Irrigation efficiency, Infiltration, Moisture availability, Water utilization, Crop response, Epidermis, Irrigation effects, Transpiration, Soil-water-plant relationships, Water conservation, Water requirements, Water utilization efficiency, Cotton, Timing.
Identifiers: Israel.

Experiments with several liquids, leaf positions and times of measurement lead to the development of a single-liquid infiltration method of measuring stomatal opening. Tests showed that use of a 2:1 turpentine-parafin oil mixture on the lower surface of the fifth to seventh leaf between 1200 and 1400 hrs. would give a practicle field method of setting cotton irrigation schedules. The infiltration index (determined from stomatal infiltration) was independent of changes in soil moisture conditions above 30-35% available soil moisture, but below this point (range of inflection) the index was very sensitive to soil moisture changes. An irrigation treatment was designed to prevent soil moisture from falling below that of the inflection range. Field test resulted in significantly greater yields from stomata infiltration scheduled irrigation. The practicle applicability of the method is discussed. (Sherbrooke-Ariz)

WATER RELEASE AS A SOIL PROPERTY RELATING TO USE OF WATER BY PLANTS,
California Univ., Riverside.
Sterling J. Richards.
Tran, Amer Soc of Agric Engineers, Vol 11, No 1, pp 74-75, 1968. 2 p, 4 fig, 5 ref.

Descriptors: *Moisture availability, Irrigation practices, Retention, Soil aggregates, Soil classification, Soil horizons, Soil structure, Field capacity, Wilting point, Tensiometers, Water storage, Moisture tention, Sudangrass, Water-plant relationships, Soil mechanics.
Identifiers: *Water-release curves, Resistance block.

The volume fraction of soil water released to growing plants is proposed as a soil property for comparing soils or evaluating structural changes in a soil. Water release is measured as a function of soil suction, utilizing a tensiometer and a resistance block. A procedure utilizing soil containers and Sudangrass is detailed. Because most field situations present various soil horizons and rooting characteristics of crops soil-water depletion varies with depth, it is recommended that tensiometers or blocks be used in each recognized soil horizon and separate water release curves be drawn. Total irrigation water depth would be the sum of all the horizons. Examples of water-release curves are given for three soils with widely varing textures. Two soils in spite of wide differences in texture had almost identical water-release curves. Treatment of one soil with an aggregating agent, VAMA, resulted in a marked increase in water release. Water release curves appear to have advantages over other procedures for evaluating the property of a soil to store water for plant use. (Sherbrooke-Ariz)

WATER ECONOMY OF AGAVE SISALANA UNDER DESERT CONDITIONS,
National Research Centre, Cairo (Egypt).
A. A. Abdel Rahman, A. M. El Gamassy, and M. S. Mandour.

Flora Abt B. Morphol Geobot (Jena), Vol 157, No 3, pp 355-378, 1967-68. 24 p, 11 fig, 13 ref.

Descriptors: *Drought resistance, *Irrigation effects, Climatic data, Transpiration, Water balance, Osmotic pressure, Plant physiology, Drought tolerance, Resistivity, Salt tolerance, Root development, Root distribution, Stomata, Turgidity, Arid lands, Water requirements, Xerophytes, Desert plants, Coastal marshes, Dunes.
Identifiers: *Agave Sisalana, United Arab Republic.

Two-year studies on plants growing naturally, plants continuously irrigated and plants irrigated only in summer were completed at two different habitats, inland desert and coastal sand dunes. All agaves planted at a salt marsh died. Hourly, monthly and seasonal changes for transpiration rate, relative turgidity, and osmotic pressure are related to environmental conditions and irrigation treatment. The results demonstrate the extreme drought resistance of this plant. Annual transpiration intensity was an extremely low 43 mg./g./h. Moderate osmotic pressure max. 29.3 atm., was reached under adverse conditions. Uprooted plants afforded a saturation deficit of up to 50% in three months, without losing their vitality. Succulence provided agaves with resistance to long dry rainless periods. Roots remained in the upper 50 cms. of soil under all treatments, deeper water being unavailable to them. Plants under irrigation exhibited longer active growth periods and were more vigorous. (Sherbrooke-Ariz)

NET LOSSES IN SPRINKLER IRRIGATION,
Technion - Israel Inst. of Tech., Haifa.
Ido Seginer.
Agr Meteorol (Amsterdam), Vol 4, No 4, pp 281-291, July, 1967. 11 p, 5 fig, 5 tab, 7 ref.

Descriptors: *Sprinkler irrigation, *Water loss, Deserts, Crop yield, Evaporation, Evapotranspiration, Soil moisture, Water utilization efficiency, Irrigation efficiency, Application methods, Timing.
Identifiers: *Net water losses, Israel.

This study estimated the difference between gross water losses and net water losses under sprinkler irrigation of corn in Israel in an attempt to evaluate the significance of published gross water loss data. Net losses were defined as the difference between the consumptive use of water of the sprinkle irrigated crop and the normal evapotranspiration of the unsprayed crop. Irrigation intervals of 3 days and 2 weeks were used with each method. Water quantities were equal. Soil moisture and dry weight yield were determined. No significant differences were exhibited between treatments, except the overhead sprinkling-3 day intermal treatment. This consumed 10% more water than the others (significant at 0.1 level). Gross spray losses of 30% have been cited in the literature for desert areas. More realistic values for large fields under normal agricultural practices and arid conditions would be 15-20%. However, net losses are not expected to rise at a similar rate, as increased gross losses replace increased evapotranspiration during irrigation, thus maintaining a relatively low level of net losses. FLOOD PLAIN INFORMATION OF BARDEN CREEK, CASPER, WYOMING-VOLUME 1.
Corps of Engineers, Omaha, Nebr.

Prepared for the city of Casper. Corps Eng Flood Plain Rep, Feb 1969. 18 p, 2 photo, 3 plate, 2 tab.

Descriptors: *Floods, *Flood damage, *Wyoming, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: Casper (Wyo), Standard project flood, Intermediate regional flood.

Flooding of Garden Creek, Casper, Wyoming is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. MICHALKA V GREAT NORTHERN PAPER COMPANY (FLOOD DAMAGE).

116 A2d 139-144 (Me 1955).

Descriptors: *Maine, *Flood damage, *Ice jams, Dams, Flooding, Flood control, Floodgates, Floodwater, Ice breakup, Riparian land, Riparian rights, Natural flow doctrine, Alteration of flow, Obstruction to flow, Legal aspects, Water law.
Identifiers: Lower riparian owner.

In the trial court, the lower riparian owner had a jury verdict in an action against a dam owner for damage due to flooding. The defendant dam owner excepted to the findings of the jury and the Supreme Judicial Court of Maine sustained those exceptions. The court held that the evidence did not sustain a proximately causal connection between the dam owner's release of water at the dam and the flooding, but instead compelled a finding that the efficient cause of the flooding was the formation of an ice jam below the property of the lower riparian owner. In so holding the court observed that a dam owner could lawfully permit water to pass over its dam in such quantities as water was flowing into the lake above the dam. (Carruthers-Fla)

GAINESVILLE STONE CO V PARKER (DAMAGE TO LAND BY FLOODING CAUSED BY IMPROPER DAM MAINTENANCE).
165 SE2d 296-300 (Ga 1968).

Descriptors: *Georgia, *Dams, *Flood damage, *Streams, Legal aspects, Judicial decisions, Floods, Spillways, Dam failure, Dam construction, Damages, Impoundments, Overflow, Water levels, Impounded waters, Rock excavation, Quarries, Residual soils, Silts, Livestock, Soils, Remedies, Farms, Adjudication procedure, Maintenance.
Identifiers: Evidence, Injunction (Mandatory).

Plaintiffs were landowners adjoining land on which the defendants operated a stone quarry and crushing business. Defendants had constructed a dam for impounding water from a stream which ran through plaintiffs' land. The plaintiffs brought this action seeking damages and injunctive relief, alleging that the defendants had raised the height of the dam and spillway which caused the water to flood plaintiffs' property and render it useless. A jury returned a verdict for the plaintiffs. The court dismissed a procedural claim by the plaintiffs which would render the case unappealable and held that the appeal could be taken. The court held a witness ex-

LIBRARY U. OF L. URBANA-CHAMPAIGN

perienced in building dams was competent to testify to the flooding which will occur if a spillway is stopped up. The court further held that a witness was competent to testify to the value of the land if, although not an expert on land value in the area, he is at least familiar with such values. The court held that all testimony given as to the value of the land was admissible and that the lower court was correct in denying the defendants' motion for a new trial. (Shevin-Fla)

PARISH OF EAST BATON ROUGE V BARBAY (COMPENSATION FOR PROPERTY TAKEN FOR DRAINAGE CANAL CONSTRUCTION).

220 S0 2d 767-769 (La Ct app 1969).

Descriptors: *Louisiana, *Drainage, *Canals, *Eminent domain, Legal aspects, Judicial decisions, Condemnation, Drainage engineering, Ditches, Surface waters, Public benefits, Compensation, Condemnation value, Damages, Natural streams, Construction, Flow augmentation.
Identifiers: Natural drainage.

The Parish of East Baton Rouge, as plaintiffs, sought to appropriate a strip of defendant's property for the construction of a drainage canal. The defendant challenged the compensation offered to him. The lot was originally crossed by a natural drain that filled during rainfall. The Parish had previously dug out this natural drain to allow the water to flow away so that at the time of this suit, the lot was crossed near its center by a small, meandering ditch. The trial court had accepted the testimony of the plaintiffs' expert witness as to the value of the land and held the compensation of $1,685 to be proper. The appellate court held that since the testimony of the plaintiffs' expert on land values had not been rebutted the trial court's determination would be upheld. The court rejected the defendant's contention that the canal construction would damage his remaining property and refused to allow him any further compensation based on this claim. The court held that the trial court's determination constituted a just and adequate compensation for the land taken and affirmed the decision of the lower court. (Shevin-Fla)

CONSTRUCTION OF IMPROVEMENT.

SC Code Ann secs 18-271 thru 18-284 (1962).

Descriptors: *South Carolina, *Drainage, *Construction, *Administrative agencies, Drainage districts, Contracts, Construction costs, Bridges, Lands, Right-of-way, Land clearing, Lumber, Outlets, Condemnation, Condemnation value, Adjudication procedure, Ditches, Drains, Watercourses (Legal), Highways, Assessments, Laterals, Engineering structures, Drainage systems, Levees, Legislation, Railroads.
Identifiers: Notice, Improvements, Competitive bidding, Fences.

Whenever an improvement is to be made in a drainage system, the drainage commission must give two weeks notice before making such improvement. There shall be competitive bidding before such improvement is contracted. The contractor may enter any lands necessary for the construction and removal of any bridge, fence or timber that will hinder the work. A right-of-way through lands not affected by the drainage system may be obtained by condemnation. Whenever the drain crosses a highway, all costs of replacing said highway shall be paid by the county. If the highway is beneficially affected, the county shall be assessed for the improvement. The commission may obtain rights-of-way over railroad crossings but the work shall be done in such a manner as to cause the least interference with the operation o of the railroad. The owner of land who has been assessed for the construction of a drainage ditch has a right to use said ditch as an outlet for lateral drains from his land. The commission may join with the proper officials of the adjoining counties of any other state in the construction or improvement of any drainage system. (Shevin-Fla)
W69-08339

PROCEDURE TO ESTABLISH DISTRICTS.

SC Code Ann secs 18-211 thru 18-224 (1962).

Descriptors: *South Carolina, *Drainage districts, *Adjudication procedure, *Public benefits, Levees, Drains, Canals, Ditches, Watercourses (Legal), Construction, Land reclamation, Swamps, Wetlands, Overflow, Public health, Tile drainage, Costs, Right-of-way, Land tenure, Assessments, Administrative agencies, Surveys, Publications, Legislation, Highways.
Identifiers: Drainage improvements, Tide gates, Notice, Public highways, Counties, Engineer.

The clerk of the court of common pleas of any county may establish a drainage district in his county. A majority of the landowners in an area may file a petition requesting a drainage district and post bond. The clerk shall then serve a summons o landowners who have not joined in the peti The summons may be served by publication. clerk shall then appoint an engineer and tw sident freeholders to examine the land and file port on the practicability of the proposed di and any benefits which might inure from it. I report is unfavorable the petition shall dismissed. If the report is favorable the clerk set a day for a hearing. Notice of the hearing be published. At the hearing it shall be determ if each landowner in the proposed district benefit. Any landowner who will not benefit be withdrawn from the district. At the hea those present shall discuss the sufficiency of district and the need for any changes. If the cle satisfied by the proceedings, he may declare district established. Any person aggrieved by decision may appeal to the court of common p for the county. (Shevin-Fla)

FLOWAGE.

NH Rev Stat Ann secs 482:16 thru 482:22 (1968).

Descriptors: *New Hampshire, *Dams, *Water policy, *Administrative agencies, Regulation, Legislation, Water law, Legal aspects, Dam construction, River regulation, Flood control, Flow, Flow control, Water levels, Riparian rights, Water conservation, Water management (Applied), Water utilization.

Upon obtaining authorization, a landowner or another with the owner's consent may erect and maintain a dam across any stream or may increase the height of any dam (by flashboards or permanent construction) for the purposes of working any mill on such stream, creating a reservoir of water or raising the level of a public lake, or conservation or equalization of the flow of such stream. The rights of others operating dams and a town's rights over highways and bridges may not be adversely affected thereby. An owner of a dam must petition the water resources board for a hearing before he is allowed to erect a dam or increase the height of an existing one. The board investigates such things as necessity of timber clearing, increased hazards to navigation, and effect on wildlife before issuing its order. This order shall incorporate all its findings. (Johnson-Fla)
W69-08354

DAMS AND FLOWAGE: PROCEEDINGS IN COURT.
NH Rev Stat Ann secs 482:23 thru 482:34 (1968).

Descriptors: *New Hampshire, *Dam failure, *Damages, *Judicial decisions, Administrative agencies, Legislation, Legal aspects, Water law, Water policy, Riparian rights, Dam construction, Dam design, Flow control, Flood control, Remedies, Damsites, Water control, River regulation, Water conservation, Land use, Water resources.

When land is overflowed, drained, or otherwise damaged by use of any dam, the person erecting or maintaining such dam is liable for the damage caused thereby. Settlement may be out of court or in the superior court of the county where such damage took place. Unless the parties agree to provisions of the petition which must state the location of the dam, extent of damages, and be filed with the court, a committee of three disinterested persons is appointed by the forum to determine the truthfulness of matters alleged in the petition. A jury trial as to the extent of damages may be had prior to reference of such petition to the committee. Any person wishing to build a new dam or increase permanently or by flashboards the size of an existing dam must petition the superior court for permission. Such person may be required to post security for damages which may arise from such action. The governor and council can approve the flooding of public lands contiguous to a damsite when the public interest is served thereby. (Johnson-Fla)
W69-08357

REGULATION OF WATER RESOURCES.
Del Code Ann Tit 7, Secs 6101-6105 (Supp 1966).

Descriptors: *Delaware, *Water resources, *Water management, *Delaware River Basin Commission, Water use, Surface waters, Ground water, Water supply, Watercourses (Legal), Administrative agencies, Ponds, Dams, Reservoirs, Lakes, Rivers, Agricultural watersheds, Domestic Water, Legislation, Legal aspects, Water law, Compacts, Administrative regulations, Planning, Water resources development, Delaware river, Equitable apportionment.

Water resources are to be regulated to assure their optimum beneficial use. Definitions of 'domestic and agricultural use', 'established average minimum flow', 'municipal use', 'surface water', 'underground water', 'water facilities', and 'watercourse' are defined for purposes of this statute. The provisions of this chapter shall not apply to (1) water use for domestic and agricultural purposes unless contributing to a water emergency; (2) a landowner's right to dam a stream originating on his property; (3) the right to build a dam or pond and divert water on any stream with a certain minimum daily flow; (4) ponds not larger than 60,000 square feet used for conservation and/or recreation. The commission shall: (1) adopt master water plans for development and use of water resources; (2) advise the Delaware River Basin Commission; (3) study and investigate matters connected with water use; (4) approve the use of water on the basis of equitable apportionment; (5) approve new plans for water facilities; (6) require reports from all Delaware water users regarding water facilities and water use and; (7) adopt reasonable rules and regulations which conform to those of the Delaware River Basin Compact, where applicable. After July 1, 1966 approval of the Commission is needed for any increase in the amount of water used. (Carruthers-Fla)

DAMS IN DISREPAIR AND CHANNEL IMPROVEMENT.
NH Rev Stat Ann secs 482:35-482:41 (1968).

Descriptors: *New Hampshire, *Administrative agencies, *Water policy, *Dams, Water law, Legislation, Legal aspects, Political aspects, Dam construction, River regulation, Flood control, Local governments, Regulation, Flow, Flow control, Water levels, Financing, Contracts, Leases, Procurement, Water conservation, Water management (Applied), Water resources, Water utilization, Condemnation, Dam construction.
Identifiers: Dam repair, Bonds, Notes.

It is state public policy to repair and construct dams, clear streams, and improve channels for the regulation of water levels, water flow, lessening of flood damage, fire prevention and control and other matters related to conservation and control of state water resources. To carry out these policies the water resources board may acquire, lease, and condemn such property as is necessary to repair or construct dams and it may enter into agreements with private individuals and corporations in furtherance of such policy. The council on resources and development constitutes an advisory board which consults with the water resources board when the latter plans initiation of facilities under this chapter. Upon approval by the resources board, proposals are submitted to the governor and council who must approve such facilities before actual work may be undertaken upon them. Municipalities may finance their share of such facilities by issuance of serial notes or bonds as they may be required in an agreement reached between the state and the local government. FOREST SITE AMELIORATION IN THE COASTAL FLATWOODS OF MISSISSIPPI,
Mississippi State Univ., State College. School of Forest Resources.
W. Frank Miller.
Completion Report, Mississippi Water Resources Research Institute, July, 1969. 17 p, 4 tab, 9 fig, 18 ref. OWRR Project A-013-MISS.

Descriptors: *Drainage, Forest soils, *Growth response, Drainage effects, *Forest management.

Increasing interest is being evidenced in the management of wetland forest sites in both the Atlantic and Gulf Coastal Plains. It is estimated that there exists over 20 million acres of these wetland sites which are not achieving their maximum potential for wood production. The results of this investigation indicate that for the particular physical soil situation examined, drainage of these lands will appreciably increase growth rates. The major effect of ditching was to provide for a more rapid removal of surface water which would normally be ponded for extensive periods. Growth response of slash pine at the end of the second growing season indicated that although there was no statistical difference between seedlings on plots with 2 1/2 chain or 5 chain lateral ditch spacing, seedling growth was significantly better on drained areas when compared with undrained areas. Loblolly pine did not respond to treatment. Growth projections for slash pine based on seedling growth, stem analysis of an older plantation, and extrapolated site index curves indicated that the drainage treatments are economically feasible. A randomized complete block study of the effects of drainage and fertilization on sweetgum and sycamore was initiated in January, 1968. At the end of the first growing season, heights of sycamore seedlings in all treatments were greater than sweetgum heights in the same treatments. Heights of sycamore seedlings in the fertilized and drained treatment were statistically superior to those seedlings in the fertilized and undrained treatment.

Descriptors: *Drainage, *Reclamation, *Wetlands, *Ditches, Drainage effects, Land management, Plant growth, Deciduous trees, Watershed management, Flood plains.

Site changes resulting from drainage of swamps and bottomlands will change stand composition, growth, and regenerative potential. Hundreds of miles of canals have already been dug to handle flow. One can only speculate about the effects on hardwood growth, fish and wildlife habitats, streamflow and soil-water levels.

HYDROLOGY OF WETLAND FOREST WATERSHEDS,
Forest Service (USDA), Charleston, S. C. Southeastern Forest Experiment Station.
Cortland E. Young, Jr., and Ralph A. Klawitter.
Conference Proceedings - Hydrology in water resources management, WRRI Report No 4, Clemson Univ, S C, p 29-38, 1968.

Descriptors: *Hydrologic cycle, *Wetlands, *Storm runoff, *Evapotranspiration, Forests, Water balance, Runoff, South Carolina, Atlantic Coastal Plain, Watersheds (Basins), Water control, *Water management (Applied), Precipitation (Atmospheric).

The resource potential of coastal plain wetland forests can be greatly increased by scientific water management; however, this cannot be accomplished without a basic knowledge of the hydrology of these areas. Preliminary results from a 400-acre wetland watershed on the Santee Experimental Forest show that average annual storm runoff was approximately twice that from forested watersheds in the Piedmont and mountains; furthermore, during wet periods peak runoff rates were double those computed for the watershed by an accepted drainage formula. Measured evapotranspir was slightly greater than Thornthwaite's pote ET.

4B. Groundwater Management

CALIFORNIA'S DIGITAL COMPUTER APPROACH TO GROUNDWATER BASIN MANAGEMENT STUDIES,
California State Dept. of Water Resources.
Ernest M. Weber, Helen J. Peters, and Michael L. Frankel.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 215-223, 1968. 9 p, 4 fig.

Descriptors: *Mathematical models, *Groundwater basins, *Water management (Applied), *Systems analysis, *California, Simulation analysis, Optimization, Data processing, Digital computers, Economics, Aquifers, Water yield, Hydrologic budget, Water storage, Surface waters, Groundwater.
Identifiers: Groundwater basin management (Calif).

The California Department of Water Resources has been developing since 1959 a computerized approach to the planning studies of integrated management of groundwater and surface water supplies, storage and transmission. Formulation and economic comparison of a wide range of alternative plans required development of computer models of the groundwater basin and the surface water delivery system, and computer programs for developing cost of each alternative plan of integrated operation under study. A 2-space dimensional-diffusion mathematical model of the groundwater basin has been developed which incorporates the nonlinear features of transmissibility variation with saturated thickness, rising and repercolating waters, and transmissibility variation at depth. Selection of the digital approach is related to data availability and the sensitivity of the economic analysis to the scale of the physical model. Digital model validation is speeded by on-line hydrograph plots. The diffusion model is also used for analysis of the surface delivery system. The economic analyses are restricted to physically feasible plans. Variable costs for each plan are developed. (Knapp-USGS)

THE CONTROL OF GROUNDWATER OCCURRENCE BY LITHOFACIES IN THE GUADALUPIAN REEF COMPLEX NEAR CARLSBAD, NEW MEXICO,
Massachusetts Univ., Amherst.
Ward S. Motts.
Bul, Geol Soc Amer, Vol 79, No 3, pp 283-298, March 1968. 16 p, 8 fig, 4 pls, 18 ref.

Descriptors: *Groundwater movement, *New Mexico, Groundwater barriers, Aquifer characteristics, Deep percolation, Base flow, Flow characteristics, Geomorphology, Obstruction to flow, Subsurface flow, Underground streams, Carbonate rocks, Caves, Geohydrologic units, Geologic control, Geologic formations.
Identifiers: *Lithofacies, Pecos River, Guadalupian Reef Complex.

It was determined that occurrence and movement of water in the Guadalupian Reef complex of southeastern New Mexico is controlled primarily by lithofacies. The following major Guadalupian lithofacies are described and related to regional hydrology: (1) a basin facies of very low permeability which confines groundwater, (2) a reef-zone facies of very high permeability, (3) a shelf-carbonate facies ranging from very high permeability near the reef-zone to low permeability near the shelf-evaporite facies and (4) a shelf-evaporite facies of moderate permeability. Permeability is greatest in coarser-grained rather than fine-grained detrital carbonates and in calcareous rather than dolomitic rocks. The presence of potable water west of the Pecos River and the highly mineralized water east of the Pecos in rocks of similar stratigraphic position indicates that the Guadalupe and Sacramento fault blocks were uplifted and trenched by the Pecos River. Highly mineralized water from the west drained into the river and fresh meteoric water could then circulate toward the Pecos River discharge area, causing extensive solution of the limestone rocks. SURFACE-WATER INFILTRATION AND GROUNDWATER MOVEMENT IN ARID ZONES OF VENEZUELA,
Instituto Venesolano de Investigaciones Cientificas, Caracas.
M. A. Tamers.
Symposium on Isotopes in Hydrology, Vienna, 1966, Proceedings pp 339-353, 1967. 15 p, 5 fig, 1 tab, 20 ref.

Descriptors: *Aquifer characteristics, *Radiocarbon, Arid lands, Evaporation, Aquifers, Artificial recharge, Carbonate rocks, Radioactive dating, Bicarbonates, Carbonates, Deepwells, Faults (Geology), Groundwater movement, Groundwater recharge, Overdraft, Natural recharge, Arid climates, Age, Infiltration, Surface runoff, Rainfall, Permeability, Transpiration.
Identifiers: *Venezuela.

Radiocarbon dating of the carbonate species present in groundwater was utilized to obtain information on the recharge of underground deposits as well as directions and rates of movement. Dissolved carbonates are of two types: modern carbon is from the atmosphere (CO sub 2) and products of plants in the soil, while ancient carbon comes from dissolving limestones. The later is essentially free of radiocarbon, causing falsely old dates for the total groundwater carbonates. Adjustments of the dates were made for the limestone contribution employing bicarbonate and total carbon concentrations. Aquifers of Barquisimeto, Maracaibo, Coro, Paraguana and Valencia in Venezuela were investigated. Ages ranged from modern to 35,000 yr. The predominance of oldwater correlates well with the arid climatic conditions. Some 'modern' artificial recharge occurred from irrigation waters. Infiltration from rivers and lakes was studied. The rapid depletion of these aquifers and their importance to the Venezuelan economy is discussed. (Sherbrooke-Ariz)

4C. Effects on Water of Man's Non-Water Activities

BRASWELL V STATE HIGHWAY AND PUBLIC WORKS COMM'N (WATER DAMAGE FROM DIVERSION).
108 SE2d 912-917 (NC 1959).

Descriptors: *North Carolina, *Water injury, *Road construction, *Diversion, Diversion structures damages, Judicial decisions, Legal aspects, Administrative agencies, State governments, Eminent domain, Easements, Property values, Flooding, Flood damage, Natural flow, Stream flow, Obstruction to flow.

Plaintiff's land and home were located in a subdivision adjacent to a highway still under construction. During the highway construction, defendants diverted a stream which on several occasions caused flood damage to plaintiff's home and property. Defendants admitted the diversion but contended that liability could be imposed on a governmental agency only for damages resultant from negligence in the road construction. Plaintiffs based their claim on the general rule that liability exists for damage resulting from a diversion of water and on the rule that the right to have water flow in the direction provided by nature is a property right which must be compensated for when destroyed. The court held for plaintiffs on their contentions above and noted that negligence need not be alleged to create liability for a diversion. (Carruthers-Fla)

Descriptors: *New York, *Pipelines, *Water supply, Judicial decisions, Legal aspects, Local governments, Relative rights, Proprietary power, Pipes, Cities.
Identifiers: *Deeds, *Covenants, Injunction, Warranty deeds.

A village laid a pipeline through a farm by right of a warranty deed. The deed required the village to place a tap on the line near the specified tenant house to allow the landowners to draw free water. The water was for the use of the tenant family and livestock in a particular barnyard. The successors in title to a portion of the land sued to compel the village to furnish them with free water. The court affirmed a judgment to dismiss the complaint. The court held that the successors' claim must fail in absence of evidence that the particular tenant house and barnyard stipulated in the deed were once located on the successors' land. (Breeze-Fla)

Descriptors: *West Virginia, *Condemnation, *Surface waters, *Condemnation value, Flood damage, Damages, Highways, Road construction, Eminent domain, Flooding, Land use, Land tenure, Compensation, Judicial decisions, Legal aspects, Drainage, Surface runoff.
Identifiers: Proceeding in mandamus.

Petitioners, as joint owners of property allegedly damaged by the construction of a new highway adjacent thereto, brought a proceeding in mandamus to compel the State Road Commissioner to institute condemnation proceedings against them to ascertain the amount of damage. Petitioners' property drained in a westerly direction across the site of the highway. Construction allegedly raised the elevation of this area and blocked this natural drainage. This caused surface water to flood their properties, damaging the land and buildings situated thereon. Evidence as to the extent of the damage was conflicting. The court held that where highway construction allegedly causes surface waters to flood property, an opportunity for judicial determination of any bona fide damage claim should be afforded the owners. The mandamus writ was granted. (Carruthers-Fla)

SOIL CONSERVATION DISTRICTS.

Md Ann Code Art 66C sec 89 (1957).

Descriptors: *Maryland, *Soil conservation, *Land management, *Political aspects, Drainage, Land, Land development, Legislation, Wildlife management, Mass wasting, Terracing, Erosion, Soil stabilization, Surface runoff, Ponds, Dikes, Flood control, Irrigation systems, Water resources, Area redevelopment, Local governments, Erosion control, Check structures.

Since agricultural lands are among the basic assets of the state, the state's policy is to preserve such lands in order to protect the health, safety, and general welfare of its people. Improper land practices have caused serious wind and water erosion of farm and grazing lands. This results in the loss of much topsoil. Failure of one owner to conserve the soil of his lands makes conservation of soil on other lands impossible. The consequences of such misuse include silting and sedimentation in stream channels, reservoirs, and dams, deterioration of soil productivity, destruction of cover and food for wildlife, and a diminishing of the underground water reserve. The correction of such problems by promotion of such appropriate soil conservation and land use practices as use of terraces, checkdams, dikes, ponds, strip cropping, land irrigation, rotation of crops and soil stabilization with trees or grasses is the policy of this state. (Johnson-Fla)

LIBRARY U. OF L., URBANA-CHAMPAIGN

aspects, Water policy, Erosion control, Land management, Soil management, Beaches, Governments, Encroachment.

Preservation and prevention of erosion on beaches in Charleston County being the responsibility of the county governing body, it must cooperate with all agencies of the United States Government to this end. However, it may deal with the federal government only when there is no state agency qualified to deal with problems of erosion and beach preservation. The Pawleys island erosion commission, composed of residents, of Georgetown County, is charged with making a study of the problem of beach erosion in the district and ways of retarding or preventing such erosion. It has power to construct and maintain such groins or other structures as are necessary to protect such beaches from encroachment by the ocean. The Greenvill County soil conservation district may acquire by condemnation such rights of way as are necessary for any authorized function of the district including acquisition of land for flood water retarding structures and flood plain boundaries. The Harry County Beach Preservation Association is charged with prevention and control of beach erosion within its district and enjoys official agency status which authorizes dealing with federal agencies. SURFACE RUNOFF AND EROSION IN THE LOWER CHAPARRAL ZONE, ARIZONA,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
Lowell R. Rich.
Forest Service USDA, Rocky Mountain Forest and Range Experiment Station. Station pap 66, 1961. 35 p, 12 tab, 20 fig.

Descriptors: *Erosion, *Chaparral, *Planting management, Thunderstorms, *Vegetation effects, Overland flow, Sediment yield.
Identifiers: *Granitic soils, *Hardware-cloth checks, Plant cover, Perennial grass.

This paper discusses the effect of recovery of vegetation, mechanical stabilization, and cover changes on storm runoff, and sediment yields from nine small watersheds located on granitic soils in the lower chaparral zone. Intense summer thunderstorms are characteristic of Arizona. Where plant cover is sparse and infiltration capacity low surface runoff (overland flow) maybe high. Surface flows may carry considerable sediment and generally increase erosion. To control erosion, management must be directed toward reduction of surface runoff. Overland flow and erosion were reduced, and a perennial grass cover was established by cutting woody vegetation, and seeding to Boer and Lehmann lovegrass. Hardware-cloth checks placed on the contour reduced erosion but did not produce additional vegetation. Most surface runoff was produced during the summer.
W69-08474

EROSION AND SEDIMENT MOVEMENT FOLLOWING A WILDFIRE IN A PONDEROSA PINE FOREST OF CENTRAL ARIZONA,
Forest Service (USDA) Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
L. R. Rich.
USDA Forest Service Rocky Mountain Forest and Range Experiment Station, Res Note 76, 1962. 11 p.

Descriptors: *Erosion, *Sediment transport, *Water yield, Ponderosa pine trees, Peak discharge, Sampling, Profiles, Streamflow, Cross-sections.
Identifiers: *Wildfire, Weir basin, Sediment trap, Experimental watersheds.

A hot wildfire burned 60 acres in the upper part of South Fork of Workman Creek Experimental Forest. The fire was not planned, but the watershed instrumentation lent itself to a fairly detailed sampling of fire effects. The fire destroyed 74 percent of the basal area of trees in the burn. The first storm after the fire was one of the most intense measured to that date. During the first summer, under nearly average total rainfall, approximately 1 acre-foot of sediment (an average of 0.016 foot) was eroded from the burn. Sediment was deposited immediately below the burn, in unburned forest vegetation, in the stream channel and in the weir pond. Only 2 percent was trapped in the weir pond, but even this was much more than before the fire. Summer storm peaks were higher than before the fire, but these higher peaks did not result in increased annual streamflow.
W69-08475

GAZING IN RELATION TO RUNOFF AND EROSION ON SOME CHAPARRAL WATERSHEDS OF CENTRAL ARIZONA,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
Lowell R. Rich, and Hudson G. Reynolds.
J Range Manage 1963, 16 (6) 322-326, illus.

Descriptors: *Runoff, *Erosion, *Grazing, *Livestock, *Wildlife habitats, Cacti, Shrubs, Watershed management.
Identifiers: *Chaparral watersheds, Forbs, Half-shrubs, Perennial grasses, Experimental watersheds.

Vegetation, water and sediment were measured on four watersheds varying in size from 9.1 to 19.5 acres between 1935 and 1952. Two watersheds were grazed while two served as checks. Precipitation averaged 20.7 inches, streamflow from one ungrazed watershed 1.9 inches and sediment losses averaged 17 to 132 tons per square mile per year. Grazing 80 percent of the growth of perennial grasses reduced their basal cover. Grazing 40 percent of perennial grasses did not adversely affect basal cover. Reduction in basal area of perennial grasses by grazing for conditions measured had no significant or practical effect on total water yield. Proper grazing of perennial grass-shrub complexes in the chaparral of central Arizona had no measurable effect upon water production or erosion.
W69-08476

EFFECT OF GRAZING ON INFILTRATION IN A WESTERN WATERSHED,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
J. R. Thompson.
J Soil and Water Conserv 1968, 23 (2): 63-65, illus.

Descriptors: *Infiltration, *Grazing, *Infiltrometers, Soil-water-plant relationships, *Erosion control, Soil management, Soil surfaces, Overland flow.
Identifiers: Infiltration measurements.

Infiltration measurements on grazed and ungrazed watersheds in the fall of 1953, 1954, 1958, and 1963, along with personal observations at other seasons of the year, suggest that seasonal variation in surface soil characteristics of the Badger Wash basin, in western Colorado overshadow any effects that might be attributed to protection from grazing. There are indications that proper soil management to maximize surface fluffiness could effectively reduce erosive runoff from high intensity rainstorms of short duration.

NSFER OF OXYGEN IN AQUEOUS SOLU-NS,
roscience, Inc., Leonia, N. J.
in L. Barnhart.
ASCE Proc, J Sanit Eng Div, Vol 95, No SA3, Pap No 6639, pp 645-661, June 1969. 17 p, 11 fig, 5 tab, 24 ref, append.

Descriptors: *Oxygenation, *Dissolved oxygen, *Aqueous solutions, *Water treatment, *Surfactants, Mass transfer, Diffusion, Solubility, Solutes, Boundary processes, Bubbles, Water chemistry, Water temperature.
Identifiers: Oxygen transfer (Bubbling).

The paper reports the results of studies which describe the influence of geometry and temperature on the liquid film coefficient and the mass transfer coefficient for the transfer of oxygen from air bubbles rising in a liquid. It is shown that the liquid film coefficient is related to the total drag force operating at the liquid gas interface. The influences of several surface active agents are discussed. At low concentrations, the principle influence of surface active agents is their effect on the bubble size and rate of rise. (Knapp-USGS)

Descriptors: *Algae, Cyanophyta, Chrysophyta, Cultures, Diagenesis, Sediments, Gas chromatography, Lipids, Oil, Oil shale.
Identifiers: *Botryococcus braunii, *Anacystis montana, *Hydrocarbons, *Olefins, Green River formation, Chlorophyll derivatives, Recent sediments, Precambrian sediments, Chlorella pyrenoidosa, Fucales, Alkanes, Alkenes, Aliphatic hydrocarbons, Petroleum crudes, Mass spectrometry, N-heptadecane, Monoenes, Dienes, Trienes.

Utilizing gas chromatography and mass spectrometry, authors studied the hydrocarbon composition of two species of algae: Botryococcus braunii, a golden-brown (chrysophyte), and Anacystis montana, a blue-green (cyanophyte). Hydrocarbons of the chrysophyte are alkenes with one, two, or three double bonds; and odd numbers of carbon atoms (in range, 17-33). Diolefins with 27, 29 or 31 carbon atoms predominate, that of 29 carbons being major component. Distribution in the cyanophyte comprises primarily monoenes with carbon atoms in range, 19-29, the major component being a monoene of 27 carbons. Heptadecane, only paraffin found, constituted 11.5% of hydrocarbons found in anacystis. Consideration of information developed in this study, together with data reported elsewhere in the literature, led authors to the following conclusions: hydrocarbons of high molecular weight are found in contemporary counterparts of ancient microscopic organisms; such hydrocarbons are present in high cellular concentrations (0.1-0.3% of dry cell weight); they possess high degree of unsaturation; they show marked odd over even predominance; and they show actual and potential similarities with patterns of ancient and modern sediments and oil shales. DETERMINATION OF TOTAL NITROGEN IN WATER BY MICROCOULOMETRIC TITRATION,
Dohrmann Instruments Co., Mountain View, Calif.
Robert T. Moore, and James A. McNulty.
Environ Sci and Tech, Vol 3, No 8, p 741-744, Aug 1969. 4 p, 5 fig, 2 tab, 5 ref.

Descriptors: *Analytical techniques, *Chemical analysis, *Water analysis, *Nitrogen compounds, Organic compounds, Nutrients, Nitrates, Chromatography, Ammonia, Gas chromatography.
Identifiers: Nitrogen analysis, Microcoulometric titration.

A new and rapid instrumental technique has been developed to measure the total of both organically and inorganically bound nitrogen in water. Conceived as a replacement for normal Kjeldahl procedures, the sytem yields duplicate analyses down to 0.2 ppm in under 10 min. The sample is pyrolyzed over a granular nickel catalyst in a stream of humidified hydrogen, the bound nitrogen in the sample being converted quantitatively to ammonia and subsequently titrated electrochemically in a pH-sensitive cell. Suitable for use with partitioning procedures, specific scrubbers, and gas chromatography, the technique is capable of rapidly revealing the organic and inorganic nitrogen spectrum in water samples. Equivalent results are obtained where the sample matrices are the typical hydrocarbons used in partitioning. (Knapp-USGS)

NATURAL AND POLLUTION SOURCES OF IODINE, BROMINE, AND CHLORINE IN THE GREAT LAKES,
Michigan Univ., Ann Arbor. Dept. of Meteorology and Oceanography.
Mary A. Tiffany, John W. Winchester, and Ronald H. Loucks.
J Water Pollut Contr Federation, Vol 41, No 7, p 1319-1329, July 1969. 11 p, 10 fig, 5 tab, 13 ref. Contract No AT (11-1)-1705AEC).

Descriptors: *Water quality, *Great Lakes, *Trace elements, *Water pollution effects, Chlorides, Halogens, Algae, Water pollution sources, Water chemistry, Water analysis.
Identifiers: *Bromine, *Iodine.

This study involves the determination of trace elements I, Br, and Cl in the Great Lakes, using neutron activation analysis of 90 water samples from Lake Superior and its tributary streams, Lake Michigan, southern Lake Huron, Lake St. Clair, western Lake Erie, and northern Lake Ontario. Possible pollution by bromine through an atmospheric route is of interest because of the combustion of leaded gasoline. Iodine deficiency in lake water may be related to thyroid disorders among marine fish which have become adapted to fresh water, and algae may offer competition for the available iodine. Chlorine is a noticeable contaminant except in Lake Superior. The Lake Superior streams appear to represent a good average of the atmospheric inputs of I, Br, and Cl. (Knapp-USGS)

PLANT NUTRIENTS IN BASE FLOW OF STREAMS IN SOUTHWESTERN WISCONSIN,
Wisconsin Univ., Madison.
Neal Minshall, M. Starr Nichols , and S. A. Witzel.
Grant V.I. 00556-04 HEW, Grant 14-01-0001-858 OWRR. Water Resources Res, Vol 5, No 3, pp 706-713, June 1969. 8 p, 1 fig, 1 tab, 9 ref.

Descriptors: *Water chemistry, *Solutes, *Nutrients, *Base flow, *Wisconsin, Nitrogen compounds, Phosphorus compounds, Potassium compounds, Provenance, Leaching, Weathering, Runoff.
Identifiers: Wisconsin River.

A 2-yr study was made of plant nutrients in the base flow of SW Wisconsin streams. The average base flow from 36 drainage areas covering a total of 643 sq mi was 4.9 in/yr. The annual nutrient losses in base flow were nitrogen, 1.1 lbs/acre; phosphorus, 0.10 lb/acre; and potassium, 1.8 lbs/acre. These losses were only 1/4 of those in the 1967 surface runoff from 0.01-acre plots at the Lancaster Experimental Farm and 3 Agricultural Research Service watersheds near Fennimore, Wisconsin. If precipitation of about 32 in. in a normal year, contains 10 lbs N/acre, fetrilizer applications 20 lbs N/acre, and subsurface or base flow an average of only 1 lb N/acre, then the other 29 lbs must be lost in surface runoff, retained for plant growth, or lost through denitrification. Total P lost per year, in the base flow was 0.1 lb/acre, which is approximately 2% of the amount applied and only 1/10 of that lost in the 1967 spring surface runoff from the Lancaster plots and Fennimore watersheds. Soluble K lost per year in the base flow was about 2 lbs/acre, about 10% of that applied and only 1/4 of that lost in the 1967 spring surface runoff. (Knapp-USGS)

Identifiers: *Thunnus germo, *Response rate, *Cesium-137, Muscle, Biological half-life, Accumulation ratio, Half-life, Sand, Scripps Institution of Oceanography.

A general form of mathematical framework has been adopted for connecting dynamic behavior and ultimate equilibrium in large oceanic fish, with possible convenience for testing hypotheses concerning migration rates and environmental factors. Formulas suggest that albacore may respond to changes in cesium rapidly and may accumulate relatively high levels. If albacore environment can be approximated by surface concentrations, biological half-life of their cesium appears to be less than 100 days. Ocean surface waters apparently are not dominant sources of cesium-137 experienced by albacore. Fallout cesium has been observed to be concentrated in surface-living fish classes, probably serving as food for tunas. Fraction of cesium entering tuna through the stomach is unknown. Large differences in concentration of cesium-137 between those typical in the Western Pacific and in surface waters near California suggested significant changes in radiocesium environment of certain albacore during migration. Available evidence suggested that large surface concentrations persisted to 200-meter depths, part of albacore's environment. Intense concentrations of fallout cesium persisting at depths near 100 meters were discovered. Organisms supporting tuna food-chain penetrate these layers daily. Albacore themselves may visit these layers frequently. (See Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

RICAL SOLUTIONS OF TURBULENT ANT JET PROBLEMS,
nia Inst. of Tech., Pasadena.
ien Fan, and Norman H. Brooks.
A 16070 DGY. W M Keck Laboratory of ulics and Water Resources, California In- of Technology, Report No. KH-R-18, Jan 04 p, 46 fig, 1 photo, 25 ref.

ptors: *Jets, *Density stratification, Diffu- lixing, Thermal stratification, Outlets, Waste n, Waste water disposal.
Identifiers: *Bouyant jets, *Forced plumes, Ocean outfalls.

Theoretical solutions were obtained on four classes of turbulent bouyant jet problems, namely, (1) an inclined, round bouyant jet in a stagnant, uniform ambient fluid; (2) an inclined, round bouyant jet in a stagnant ambient fluid with linear density-stratification; (3) an inclined, slot bouyant jet in a stagnant, uniform ambient fluid; (4) an inclined, slot bouyant jet in a stagnant ambient fluid with linear density-stratification. This report is a summary of the numerical solutions on bouyant jets in stagnant environments carried out in connection with previous investigations by Fan, Fan and Brooks, and Brooks and Koh. Using the integral type of analysis, assuming similarity, predictions can be made for jet trajectory, widths, and dilution ratios, in a uniform or density-stratified environment without ambient currents. Numerical solutions have been presented in dimensionless form for a wide range of initial conditions including the effect of the initial angle of discharge. Problems with non-linear density profiles are not readily treated in generalized non-dimensional form. Rather it is more feasible to make case by case calculations using dimensional variables. A program for such calculations for a round jet is available in a technical memorandum by Ditmars. These solutions are useful in the design of disposal systems for sewage effluent into the ocean or cooling water into a lake.

WATER QUALITY AS AFFECTED BY A WYOMING MOUNTAIN BOG,
Forest Service (USDA), Laramie, Wyo. Rocky Mountain Forest and Range Experiment Station.
David L. Sturges.
Water Resources Research, 1967, 3 (4): 1085-1089, Illus.

Descriptors: *Water quality, *Bogs, *Chemical properties, *Physical properties, *Coliforms, Groundwater, Perennial streams, Peat, Potable water, Fen, Wyoming.
Identifiers: Seasonal changes in water quality.

Waters collected July through October 1965 at a Wyoming mountain bog were analyzed for potability and seasonal changes in calcium, magnesium, potassium, iron, and silica. Four locations were sampled: effluent stream, fissure locations in the bog, peat locations in the bog, and ground water. The color and turbidity of peat water greatly exceeded that at other locations and the maximum levels established by the U. S. Public Health Service for drinking water. The dissolved mineral content of all waters was very low, and the waters were of excellent chemical quality. All waters contained coliform organisms, probably of a nonfecal origin in peat and fissure water. The concentration of minerals in peat water remained constant through the sampling period. Mineral concentrations in ground water increased in September, when the water table was at a seasonal minimum, but decreased in October following water table recharge. Silica levels were higher than other ions at all locations; the highest levels were in peat water.
W69-08455

GROSS ALPHA AND BETA RADIATION IN WATERS AT A WYOMING MOUNTAIN BOG,
Forest Service (USDA), Laramie, Wyo. Rocky Mountain Forest and Range Experiment Station.
David L. Sturges, and Robert E. Sundin.
Water Resources Research, 1968, 4 (1): 159-162, Illus.

Descriptors: *Fallout, *Radioisotopes, *Groundwater, *Perennial streams, *Snowpack, *Bogs, Fen, Wyoming.
Identifiers: Gross alpha radiation, Gross beta radiation, Radionuclide filtration.

Waters collected between July and October 1965 from four locations at a mountain bog were analyzed for radiologic content. The gross alpha and beta content of waters was less than 5 and 10 pc/liter, respectively. Gross beta activity of filterable solids in ground water collected above the bog reached 400 pc/gram when the water table was at a seasonal minimum, but on other dates and at bog and stream locations, the gross beta activity of filterable solids was less than 100 pc/gram. Radiation levels in waters from snow, overland flow, and stream sources were measured in May, June, or October 1965. Snow water activity was less than 25 pc/liter, but filterable solids had a maximum gross alpha and beta activity of 243 and 1348 pc/gram, respectively. Standing vegetation, litter, and moss on the bog surface screened radionuclides from snowmelt water. Radionuclide filtration on watersheds is significant from a public health standpoint.
W69-08457

EFFECT OF A WATERSHED TREATMENT WITH PICLORAM ON WATER QUALITY,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
E. A. Davis, P. A. Ingebo, and C. P. Pase.
USDA Forest Serv Res Note RM-100, 4 p. 1968.

Descriptors: *Herbicides, *Water pollution, *Pesticide residues, *Brush control, Pesticides, Brush, Soil treatment, Watershed management, Forest management, Agricultural chemicals, Chemicals, Pesticide toxicity, Chaparral, Water quality, Wildlife, Aquatic life.
Identifiers: *Picloram, Woody plant control.

A soil application of picloram pellets (9.3 lb. acid equivalent per acre), on a 2-acre side drainage of a 46 acre chaparral watershed in central Arizona, resulted in the movement of detectable amounts of picloram into the stream water. The highest concentration of picloram found was 0.37 ppm; this concentration occurred after a 2.53-inch rainstorm 5 days after treatment. The extent of movement of picloram into the stream water was related to rainfall duration and amount. After a total of 40 inches of rain during a 16-month period, picloram was no longer detected in the stream water. Possible effects of watershed treatments with picloram on livestock, wildlife, aquatic organisms, and irrigated crops are considered.

5C. Effects of Pollution

AN APPRAISAL OF WATER POLLUTION IN THE LAKE SUPERIOR BASIN.
Federal Water Pollution Control Administration, Chicago, Ill. Great Lakes Region.

Fed Water Pollut Contr Admin, Great Lakes Reg Rep, Apr 1969. 107 p, 7 fig, 3 tab, 56 ref, 3 append.

Descriptors: *Water pollution, *Lake Superior, *Water quality control, *Water quality act, Waste treatment, Sewage treatment, Legislation, Water management (Applied).
Identifiers: *FWPCA.

Studies of the water quality and pollution problems of the Lake Superior basin made by FWPCA and cooperating agencies are summarized. The esthetic value of Lake Superior is of major importance. Increases in the range of 2-50 ppb of heavy metals such as copper, chromium, zinc, and cadmium will have lasting deleterious effects upon the lake. The exteme clarity and cold temperature of the waters of Lake Superior are a necessity to support its present ecology. Lake Superior is an oligotrophic lake, but nutrient values in some areas of the lake have been reported at levels approaching those commonly associated with nuisance algal growths, but other factors, such as temperature, are limiting. Municipal and industrial wastes with high concentrations of BOD has caused oxygen depletion in the St. Louis River, Duluth--Superior harbor, and Montreal River. The deposition of polluted dredgings contributes to the degradation in quality of Lake Superior. It is recommended that quality criteria reflect more appropriately the uniqueness of the lake. Secondary biological waste treatment should be provided by all municipalities. Existing combined sewers should be separated. (Knapp-USGS)

SOME EFFECTS OF PESTICIDES ON MISSISSIPPI WATERS,
Mississippi Game and Fish Commission, Jackson. Fisheries Div.
C. Rex Bingham.
Proc Miss State Univ Water Resources Res Inst Conf, Apr 8-9, 1969, pp 63-71, 1969. 9 p, 4 tab, 8 ref.

Descriptors: *Pesticides, *Water pollution sources, *Mississippi River, *Mississippi, Fishkill, Pesticide toxicity, DDT, Phosphothioate pesticides.
Identifiers: Yazoo River (Miss).

Wolf Lake and Mossy Lake, in the Mississippi Delta, were sampled to study the amounts of pesticides in the water and sediment and the effect of pesticides on fish. DDT, TDE, and DDE were found on 15 of 15 sampling dates in Wolf Lake and on 11 of 15 in Mossy Lake. Toxaphene was found 10 of 15 days in Wolf Lake and 1 of 15 days in Mossy Lake. Methyl parathion was found in both lakes on 2 days. Pesticide concentrations were low to medium in February to early March, peaked in the spring, declined in the summer, and rose in autumn. Bluegills in Mossy Lake averaged 1.013 ppm DDT, and in Wolf Lake, 5.041 ppm. Largemouth Bass were planted in Wolf Lake but did not survive, possibly because of pesticides. (See W69-08221). INFLUENCE OF ENVIRONMENTAL FACTORS ON THE CONCENTRATIONS OF Zn-65 BY AN EXPERIMENTAL COMMUNITY,
Bureau of Commercial Fisheries, Beaufort, N. C. Radiobiological Lab.
T. Duke, J. Willis, T. Price, and K. Fischler.
Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche. Symp on Radioecology, Proc 2nd National Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 355-362. 3 fig, 1 tab, 18 ref.

Descriptors: *Zinc radioisotopes, *Environmental effects, Salinity, Temperature, Sea water, Oysters, Clams, Crabs, North Carolina, Sediments, Radioactivity, Marine animals, Estuarine environment, Fallout, Nuclear explosions, Biota, Spectrometers, Bacteria, Algae, Sands, Hydrogen ion concentration.
Identifiers: *Concentrations, Aequipecten irradians, Pivers Island (N C), Detector, Beaufort (N C), Crassostrea virginica, Mercenaria mercenaria, Panopeus herbstii.

Capacity of organisms to concentrate elements from seawater is affected by changes in environmental factors that alter the physiological condition of the organisms or the physical-chemical properties of elements. This knowledge is needed to evaluate potential hazards from radioactive pollution. Zinc-65 (Zn-65) enters the biochemical cycle of the estuarine environment in fallout from nuclear weapons and in effluent from nuclear reactors, occurring in measurable amounts in estuarine biota, sediments, and water. A polyfactorial approach is required to study the concentration of radioisotopes. Differences in salinity, temperature, pH, and zinc in seawater significantly affected the concentration of Zn-65 of a community of oysters, clams, mud crabs, and scallops, and their sediment substrate. A factorial analysis of variance showed no interactions among the environmental factors. High salinity and zinc concentration suppressed the concentration of Zn-65 in animals and sediment, whereas high temperature and pH HAD THE OPPOSITE EFFECT. Temporal variation in concentration factors for control animals and sediment was significant during the experiment. Such variation must be considered when reporting concentration factors for radionuclides in marine organisms. Data from this experiment represent a first step toward prediction of the fate of a radioisotope released into an estuary. (See Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wisc)

Zinc-65 (Zn-65) accumulation was measure
oysters bedded in discharge canal of Pacific
and Electric Company's Humboldt Bay Po
Plant (nuclear-powered electric). Oysters of
1962 and 1964 brood were reared on
suspended from a raft, facilitating exposure
radioactive wastes discharged from the plant
this canal. Monthly average concentrations of
65 in the waters of the discharge canal during
study ranged from 1.04 to 19.63 femtocuries/
liliter. Oysters were sampled as new groups
added, for over 400 days. Concentration of Zn
in the wet meats of the oysters varied from 0.9
174.0 picocuries/gram. Changes in concentrat
of Zn-65 in oysters followed changes of Zn-6
discharge waters. Concentration for the
brood ranged from 5600 to 12,000, and from 8
to 11,000 for the 1964 brood. Assuming cons
pumping and filtering rates for the oysters, a fa
for efficiency of absorption was determined to
less than 0.4% for the 1964 brood. Human pro
diet of oysters raised in canal would provide
imum concentration well within permissible
burden. (See Vol. 2, No. 18, Field 5C, W
07441). (Jones-Wisc)

Identifiers: Detector, Alaska, Hudeuc Lake, Pullin Lake, Graphite Lake, Old John Lake, Pingo Lake, Twelve Mile Lake, Brant Lake, Imikpuk Lake, North Meadow Lake, Gyttja, Duff, Ooze, Cobbles, Equisetum, Thorium-232, Yukon River, Nebesna River, Moose Creek, Arctic Circle Hot Springs, Radon, Central City (Colo), Mutation, Beta rays, Cosmic radiation, Steese Highway, Point Barrow.

High human whole-body counts of Eskimo population in northern Alaska introduced through fallout particles from nuclear weapons testing prompted study of background radiation in various Alaskan lakes. Measurements of ionizing radiation, made during 1965 in 9 lakes, 3 rivers, 1 hot springs area, and adjacent terrestrial substrates in Alaska, indicated that background radiation in these habitats varied greatly. The lakes were characterized by a small amount of ionizing radiation at mid-depths and increasing quantities near the air and sediment boundaries. Moreover, radioactivity of sediments near shore was 3.2 times greater as that near the center. This pattern of background radiation has been relatively consistent in natural lakes of diverse geographic areas; hence, a model for background radiation in freshwater lakes is proposed. Variations in this model were a function of local differences in geologic substrates and input of allochthonous materials. Radioactivity from sediments in Arctic tundra ponds was due to naturally occurring radionuclides with probable effects on biota. Authors speculate that organisms living in or near sublittoral sediments of lakes in recent times might undergo more frequent genetic changes than plankton or organisms in deepwater sediments. TRANSFER OF Zn-65 and Cr-51 THROUGH AN ESTUARINE FOOD CHAIN,
Bureau of Commercial Fisheries, Beaufort, N. C. Radiobiological Lab.
John P. Baptist, and Curtis W. Lewis.
Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 420-430. 5 fig, 5 tab, 28 ref, disc. Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Zinc radioisotopes, *Chromium, *Radioactivity, *Estuarine environment, *Food chains, Phytoplankton, Brine shrimp, Fish, Trophic level, Sea water, Chlamydomonas, Temperature, Salinity, Gamma rays, Spectrometers, Zooplankton, Gonads.
Identifiers: Mummichog, Micropogon undulatus, Eucinostomus, Half-life, Muscle, Gills, Spleen, Liver, Digestive tract and contents, Artemia, Fundulus heteroclitus, Radionuclide concentrations, Radionuclide uptake, Concentration processes.

Transfer of assimilated and unassimilated zinc-65 (Zn-65) and chromium-51 (Cr-51) was followed under controlled conditions through an experimental food chain, including phytoplankton, brine shrimp, post-larval fish, and mummichog. Food-chain transfer of Zn-65 and Cr-51 studies are needed because these radionuclides are released in relatively large amounts and accumulated by organisms in aquatic environments. Two separate but similar experiments were conducted measuring uptake of Zn-65 and Cr-51 from food; uptake from water was measured in conjunction with one of the two experiments. Both radionuclides were successively transferred through each level to the fourth trophic level, and concentrations generally declined up the food chain. Assimilated concentrations of Zn-65 were higher than those of Cr-51 in all trophic levels. Preliminary experiments indicated that organisms of each trophic level emptied their digestive tracts of radioactive contents within 48 hours when radioactive food was followed by non-radioactive food. Experimental data were used to calculate theoretical maximum concentrations. Comparison of results from the food chain with results of experiments on uptake from seawater indicated that the food chain was generally the more efficient pathway for uptake of Zn-65 and Cr-51 by all trophic levels except the second. (See Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

THE PHOSPHORUS AND ZINC CYCLES AND PRODUCTIVITY OF A SALT MARSH,
Georgia Univ., Athens. Dept. of Zoology.
L. R. Pomeroy, R. E. Johannes, E. P. Odum, and B. Roffman.
Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 412-419. 3 fig, 1 tab, 33 ref.

Descriptors: *Zinc radioisotopes, *Phosphorus radioisotopes, *Salt marshes, *Cycling nutrients, Georgia, Sediments, Bacteria, Detritus, Estuaries, Plankton, Ecosystems, Sinks, Tracers, Crabs, Shrimp, Mullets, Fish, Algae.
Identifiers: Duplin River (Ga), Spartina alterniflora, Organisms, Tursiops truncatus, Brevoortia tyrranus, Concentration processes.

By synthesizing results of experiments using phosphorus-32 (P-32) and zinc-65 (Zn-65) with earlier work in Georgia salt marshes, the cycles of the elements P and Zn are described quantitatively. Marsh grass and sediments dominate both cycles. The uppermost meter of sediments contains enough P to support Spartina production for 500 years and enough Zn for 5000 years. Spartina production removes P and Zn from subsurface (reduced) sediments and introduces them into the water (via bacterial utilization and subsequent utilization by detritus feeders) at a rate that replaces total water P in a month and total water Zn in a year. Significant part of P is exported from the marsh in organisms and detritus. The P and Zn in estuarine water are in equilibrium with plankton, bacteria, and surface (oxidized) sediments. Equilibrium strongly favors the sediments. Subsurface-sediment compartment of P and Zn is probably replaced by conversion of oxidized sediments to reduced sediments through creek meandering. Oxidized sediments are in equilibrium with water receiving inputs of P and Zn from land and sea. Transfer of P and Zn from deep sediments to water by Spartina explains the high concentration of these elements in the water. (See Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

A COMPARISON BETWEEN THE UPTAKE OF RADIOACTIVE AND STABLE ZINC BY A MARINE UNICELLULAR ALGA,
Comitato Nazionale per l'Energia Nucleare, La Spezia (Italy).
M. Bernhard, and A. Zattera.
Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 389-398. 5 fig, 7 ref, disc. Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Zinc radioisotopes, *Marine algae, *Resins, Sea water, Physicochemical properties, Tracers, Distribution, Chelation, Detergents, Radioactivity, Amino acids.
Identifiers: *Radionuclide uptake, *Phaeodactylum tricornutum, EDTA, Ligurian Sea, European Mediterranean.

Organic substances occurring in seawater or introduced as contaminants, e.g., detergents, may chelate zinc and influence its availability to algae. Uptake of zinc-65 (Zn-65) AND STABLE ZINC BY A MARINE UNICELLULAR ALGA (Phaeodactylum tricornutum) and by a chelating

resin (Chelex-100) was studied in batch cultures during a certain time interval. In all experiments, the distribution pattern of Zn-65 and stable zinc between particulate matter (algae or chelating resin) and natural and artificial seawater medium differed. When Zn-65 was added as ionic zinc, proportionately much more radioactive zinc was taken up than stable zinc. However, when Zn-65 is added as Zn-EDTA-complex to a batch containing seawater and Chelex, stable zinc was initially taken up at a higher rate than was Zn-65. These preliminary results do not explain the difference in distribution of radioactive and stable zinc, but the data show that uptake rate of the stable isotope does not necessarily follow uptake rate of the radioactive isotope if the two are present in different physical-chemical states. This possibility must be taken into account in tracer studies and in predictions of the distribution of radioisotopes in environment based on specific isotope content approach. (See Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

METABOLISM OF ZINC-65 IN EUPHAUSIIDS,
Oregon State Univ., Corvallis; and Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
Scott W. Fowler, Lawrence F. Small, and John Mark Dean.
Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 399-411. 8 fig, 34 ref, disc. Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Zinc radioisotopes, *Marine animals, *Crustaceans, *Metabolism, *Temperature, Radioactivity, Guts, Oxygen, Tracers, Oregon, Gamma rays, Spectrometers, Columbia River, Weight, Surfaces, Cycling nutrients.
Identifiers: *Euphausia pacifica, *Thysanoessa spinifera, Exoskeleton, Eyes, Muscle, Body fluid, Autoradiographs, Detector, Half-life, Radionuclide uptake, Radionuclide concentration, Radionuclide elimination, Concentration processes.

To help understanding of biological role of zinc in marine food-chain organisms, authors studied uptake and retention of zinc-65 (Zn-65) by the pelagic crustaceans Euphausia pacifica and Thysanoessa spinifera. Experiments were performed at three temperatures (5, 10, and 15 deg C) and two concentrations of radiozinc (10 and 25 microcuries/liter). Weight-specific uptake and elimination of Zn-65 by dead (formalin-preserved) animals and by live animals (before molting) were statistically similar over all temperatures and Zn-65 concentrations tested. Molted exoskeletons averaged 41% of total live body activity. Largest fraction of radiozinc was associated with exoskeleton. Second largest fraction was associated with muscle and gut, with a smaller fraction in eyes and body fluid. Autoradiographs showed Zn-65 mainly located on exoskeleton and between muscle fibers, not intra-myofibrillar. Weight-specific activity varied inversely with weight, suggesting surface area phenomenon for uptake and loss. Relationships between Zn-65 uptake and dry weight, and between oxygen consumption and dry weight, varied by an order of magnitude. Authors conclude that Zn-65 uptake from water is neither directly nor indirectly related to euphausiid metabolism, which are potentially important in cycling of radioactivity from 'hot' pools in the sea. (See Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

THE POTENTIAL IMPORTANCE OF SPARTINA ALTERNIFLORA IN CONVEYING ZINC, MANGANESE, AND IRON INTO ESTUARINE FOOD CHAINS,
Bureau of Commercial Fisheries, Beaufort, N. C. Radiobiological Lab.
Richard B. Williams, and Marianne B. Murdoch.
Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 431-439. 4 fig, 3 tab, 21 ref, disc. Available from Clearinghouse as CONF 670503 at $3.00 in paper copy and $0.65 in microfiche.

Descriptors: *Zinc radioisotopes, *Manganese, *Ron, *Estuarine environment, *Food chains, Radioactivity, Cycles, Salt marshes, North Carolina, Phytoplankton, Detritus, Radioisotopes, Sediment, Spectrometers, Atlantic Ocean, Standing crop, Productivity, New Jersey, Georgia, Delaware, Plant growth.
Identifiers: *Spartina alterniflora, Beaufort (N C), Sprout stage.

This study was conducted to increase insight into the flow of energy and materials in an estuarine ecosystem. Potential importance of cord grass, Spartina alterniflora, in conveying radioisotopes of zinc, manganese, and iron into estuarine food chains was evaluated on the basis of its annual production, its content of the three elements, and its annual cycle of growth and decay. Growth of Spartina was studied with harvest and other techniques, in salt marshes near Beaufort, North Carolina. Standing crop at maturity (in the fall) and annual production were estimated to average 545 and 650 grams dry weight per square meter, or 208 and 248 grams of carbon per square meter, respectively. Spartina production approached one-third the total phytoplankton net production of adjacent estuaries, and was thus potentially important in estuarine food chains. Zinc, manganese, and iron all had markedly higher concentrations in dead Spartina than in live, and averaged 22, 200, and 5000 parts/million (dry weight), respectively, in dead material. Unusually high iron content of the dead material suggested that Spartina detritus may be especially important in the movement of radioisotopes of iron from water and sediment into estuarine animal populations. Descriptors: *Eutrophication, Algae, Ducks, Color, Fishkill, Lakes, Odor, Toxicity, Water pollution effects, Water quality, Cattle.
Identifiers: *Definitions, *Water bloom, Toxic algae, Recreational use.

This lexicon of lake terminology defines a water bloom as: 'A prolific growth of plankton. A bloom of algae may be so dense that it imparts a greenish, yellowish, or brownish color to the water. The growth may be so concentrated in some parts of a lake that it interferes with swimming and boating. The algae not only imparts a disagreeable odor, but it may be a cause of fish mortality, and some species may be poisonous to cattle and ducks and a menace to drinking water supplies.' This entry includes an aerial photograph of an algal bloom concentrated in bay of a lake. (Eichhorn-Wis)

Identifiers: *Corrective treatment, *Preventati treatment, Algae nuisance, Algae bloom, Alg growth, Water density, Convection currents, Alg treatment costs, Dinobryon, Concord (N H), anacook Lake (N H).

Author briefly reviews characteristics of algae a associated problems in New Hampshire water su plies, outlining preventative measures togeth with easiest and most economical controls used date. Symptoms are undesirable taste and odor water supplies, blooms in reservoirs, fouled pip and clogged filters. Occurrence of algae is fluenced by light, temperature, convection c rents, density stratification (spring and fall t novers circulate bottom materials and algae, oft initiating algal bloom), and nutrients wh promote algal growth. Ideally, each waterwo should periodically examine samples microsco cally to monitor algae species and apply preven tive treatment before nuisance levels are reach Algal control in most of New Hampshire's public surface water supplies is practicable and expensive. Penacook Lake, supplying water Concord, has a problem caused primarily by species Dinobryon; this lake could be treated w copper sulfate to a depth of ten feet (3,380 a feet) for $340. Municipalities can obtain help fr New Hampshire's Water Pollution Commission Sanitary Engineering Division for identification organisms and recommended dosages of cop sulfate. Use of chlorination and copper sulf seem the best available means and only accepta chemicals for treating their water suppli (Ketelle-Wis)

putational method is presented for estimat- e possible saving in water resulting from the lakes or existing reservoirs instead of cooling for the dissipation of excess heat. This is a n areas where water supplies are scarce. For o reservoirs studied, annual water savings, akes instead of cooling towers, were found to - 50 percent. However, these figures do not apply to reservoirs built solely to dissipate excess heat, because the resulting evaporation rate (added surface and added heat) will be greater than the amount of water used in cooling towers. AN INVESTIGATION INTO THE EFFECTS OF WARMED WATER FROM MARCHWOOD POWER STATION INTO SOUTHAMPTON WATER,
Southampton Univ. (England); Southampton Harbour Board (England); and Central Electricity Generating Board, Southampton (England).
John P. M. Pannell, Albert E. Johnson, and John E. G. Raymont.
Proceedings of the Institution of Civil Engineers, pp 35-62, Oct 16, 1962. 28 p, 17 fig, 4 tab, 3 ref.

Descriptors: *Cooling water, Plankton, Salinity, Thermal pollution, Outfall chamber, Tidal cycles, Aquatic environment.
Identifiers: *Warmed water, *Warmed water discharge, Cooling pond, Sea temperature, Limnoria, Teredo, Marchwood Power Station, Southampton water.

The new generating station at Southampton has resulted in a rise of about 50 F. in an area of Southampton water about 1/4 mile radius around the station outfall. The Fawley Refinery has had a similar effect on its own area. The tidal currents move the warm water for considerable distances in a layer below the cold fresh and above the cold salt water, the streams tending to keep to the southern shore of the estuary. The dispersal patterns are extremely complicated. Other than the wind, the maximum portion of the warmed water from Marchwood Generating Station into Southampton water is caused by salinity variations and the physical position of the intake and outfall structures. Thermograph readings at the intake show that equilibrium has not yet been reached, because the temperature of the deeper water is still slowly rising. In similar estuaries with wide salinity variations it can be expected that dispersion of heat will be by mixing and not by cooling to atmosphere. With one exception, re-circulation has not taken place and the Marchwood Basin tends to act as a sump. The breeding period of Limnoria has been extended and the incidence of Teredo appears to have increased. There appears to have been no diminution in the total amount of plankton over the years. ENVIRONMENTAL ASPECTS OF THERMAL STATION DESIGN,
Burns and Roe, Inc., Oradell, N. J.
R. T. Richards.
Civil Engineering, pp 45-47, May 1968. 3 p, 3 fig.

Descriptors: *Thermal pollution, *Environmental effects, *Cooling tower, *Thermal power plants, *Power plant, Fisheries, Hydraulic models.
Identifiers: U.S. Army Corps, Dry tower, Wet tower.

Power companies are facing an increaxing problem of finding thermal plant sites acceptable from an environmental standpoint. The siting and design are complicated by a lack of firm and reasonable environmental criteria for determining site suitability. Public authorities need basic scientific information on the long-range effects of adding heat to streams. The interest and money of both private corporations and public agencies is available for this study now that thermal pollution has become recognized as a national problem. Cooling towers are suggested as a solution to the heat loading by these large plants. A conservative public, however, objects to their large size and cost. Another disadvantage is the production of fog. Other solutions are off-stream cooling ponds, dilution and dispersion of the warm water, and combinations of the above methods. (Sherman-Vanderbilt)

THERMAL DISCHARGES,
Michigan Univ., Ann Arbor. School of Public Health.
Ronald H. Laberge.
Water and Sewage Works, p 536-540, Dec 1959. 5 p, 1 tab, 5 fig, 16 ref.

Descriptors: *Thermal pollution, *Thermal loading, Stream aquatic environment, Domestic wastes, Industrial wastes, Toxicity, Oxygen demand, Dissolved oxygen, Self-purification, Reaeration, Saturation.
Identifiers: Aquatic Life Advisory Committee of the Ohio River Valley, Water Sanitation Commission, Trout.

The intention of this paper is to explain the effects of temperature on a stream. Thermal loadings to streams are rapidly becoming a critical problem in regard to maintaining a healthy lotic environment. Fish and aquatic life are discussed with reference to: the optimum, tolerable and critical temperature levels, chemical toxicity and oxygen requirements. The stream temperature is discussed in terms of depth, season and distance from discharge. It is described as an agent in relation to other environmental factors for which some data is given. The effects of temperature self-purification characteristics of a stream are shown by means of a hypothetical river situation. The relation of oxygen, deoxygenation and reaeration are quantitatively developed. A method is presented for computing the allowable thermal loading to meet required minimum dissolved oxygen levels. ESTIMATING FORCED EVAPORATION FROM COOLING PONDS,
Geological Survey, Denver, Colo.
G. Earl Harbeck, Jr.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol 90, No PO3, pp 1-9, Oct 1964. 10 p, 2 fig, 5 ref.

Descriptors: *Thermal pollution, *Water management, *Power plants, Energy budget, Mass transfer, Meteorological data, Reservoir.
Identifiers: Natural inflow, Energy storage, Water surface, Cooling pond, Bowen ratio, Wind profile.

Based on energy-balance concepts, a graph has been developed to permit the estimation of the increase in evaporation, or forced evaporation, resulting from the addition of heat by a power plant to a cooling pond or reservoir. In order to use the graph, the data needed are the amount of heat added by the plant, the air temperature and the wind speed measured at the nearest weather station. The percentage of heat that is added and that is utilized in measuring evaporation increased with both wind speed and temperature. Simplifying assumptions and approximations have been made. RECIRCULATION OF COOLING WATER IN RIVERS AND CANALS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
Gaza L. Bata.
Journal of the Hydraulics Division of the American Society of Civil Engineers, Vol 83, No HY3, p 1265-1 thru p 1265-26, June, 1957. 26 p, 17 fig, 12 ref.

Descriptors: *Design criteria, *Recirculated water, Coolants, Diversion, Flow, Froude number, Stratification, Upstream, Downstream, Rivers, Canals.
Identifiers: Intake, Outlet, Warm wedge, Interface.

The recirculation of water after it has been used as a coolant in thermoelectric plants and returned to the river or canal from which it was originally drawn is of great importance to the economy of operation of such plants. Among the many factors that affect the amount of recirculation, the most important ones are the channel and discharge, the

INSTITUTE OF LAND AND WATER RESOURCES

distance between intake and outlet of the flow diverted for cooling, the degree of heating of the diverted water, and the relative amount of diversion. three major conclusions concerning the recirculation of cooling water at a stream plant may be drawn: (1) the three zones of flow are not influenced by one another; the critical depths are established at the end sections of the upstream and middle zones; (2) in the three-dimensional case with side intake and outlet, the amount of recirculation is governed in magnitude by the depths immediately upstream and downstream from the side intake; and (3) the amount of recirculation for the two-dimensional case of a bottom-slot intake is much less than that for a side intake. SELECTIVE WITHDRAWAL FROM DENSITY - STRATIFIED RESERVOIRS,
California Inst. of Tech., Pasadena.
Norman H. Brooks, and Robert C. Y. Koh.
Journal of the Hydraulics Division, ASCE Vol 95, No HY4, p 1369-1400, July 1969. 2 p, 12 fig, 28 ref.

Descriptors: *Reservoirs, *Stratified flow, *Withdrawal, Fluid flow, Hydraulics, Outlets, Selectivity, Water quality.
Identifiers: Laboratory tests, Mathematics.

Analyses and experiments for selective withdrawal flows from linearly stratified fluids, including inviscid, viscous, and turbulent cases are presented. A review of discrete layer systems is also included. These thin jet-like flows have been observed both in the laboratory and in large reservoirs, and boundary layer assumptions appear to be justified. For turbulent withdrawal flows away from immediate vicinity of the outlet, it is hypothesized that Koh's viscous diffusive experiments and analysis can be applied by replacing the kinematic viscosity, v, and the molecular diffusivity, D, by the vertical eddy diffusivity, Em. For self-generated turbulence, it is predicted that the proper characteristic length is a= (q/ (sq. rt. of (g (epsilon))) to the 1/2 power, in which q= the unit discharge and (epsilon)= -(1/po) dp/dy. Equations and a graph are given for predicting the thickness of the withdrawal layer under various flow assumptions from real reservoirs. Transients are also presented. The results of this paper may be used in predicting the performance of a multioutlet system in dams for water quality control by selective withdrawal. (Hsieh-Vanderbilt)

CONDITIONS FOR COEXISTENCE OF AQUATIC COMMUNITIES WITH THE EXPANDING NUCLEAR POWER INDUSTRY,
Bureau of Commercial Fisheries, Washington, D. C. Resource Management Branch.
William S. Davis.
Nuclear Safety, Vol 10, No 4, p 292-299, July-August 1969. 8 p, 15 ref.

Descriptors: *Thermal pollution, *Radioactive wastes, *Nuclear power plants, *Aquatic environment, Waste-discharge, Water quality control, Water pollution effects, Heavy metals, Chemical wastes, Absorption, Retention, Distribution, Copper, Bioassay, Diversion.
Identifiers: Contaminated zone, Intrastate, National Technical Advisory Committee.

Communities of aquatic plants and animals cannot indefinitely withstand indiscriminate use of their environment for disposal of the thermal, radioactive, and chemical waste of nuclear and fossil-fueled thermoelectric production. The diversion of large quantities of water for use in cooling condensers may also be harmful. Although developing water-quality standards will limit introduction of such wastes into interstate and coastal waters, they will not regulate specifically the amount of water taken into power plants for cooling. New regions of temperature, radioactivity, and chemistry will be established in many interstate and coastal waters when the limits imposed by water-quality standards and licensing authorities are attained nationwide. The efforts of aquatic biologists and engineers must be complementary to ensure wide use of the water resources of the nation. (Sherman-Vanderbilt)

THE EFFECTS OF THERMAL POLLUTION ON RIVER ICE CONDITIONS,
Army Terrestrial Sciences Center, Hanover, N. J.
S. L. Dingman, W. F. Weeks, and Y. C. Yen.
Water Resource Research, Vol 4, No 2, pp 349-362, Apr 1968. 14 p, 7 fig, 1 tab, 2 ref.

Descriptors: *Thermal pollution, *Ice, *Rivers, *Navigation, Differential equation, Hydrometric variables, Meteorologic variables, Energy budget.
Identifiers: *Ice-free reaches, St. Lawrence Seaway, Mississippi River, Minneapolis - St. Paul (Minn).

An attempt is made to calculate the length of the ice-free reach that develops during the winter below a thermal pollution site on a river. A differential equation for the steady-state heat balance of a volume element of a river is developed. The computer program makes possible more universally applicable estimations. The differential equation for the steady-state heat balance of a volume element of a river leads to the expression x= Cx times the integral from Two to Twx of dTw over Q*, where x is distance downstream from the pollution site to the cross section where the water temperature equals Twx, Two is water temperature at x equals zero, Q* is rate of heat loss from the water surface, and Cx is a constant that includes flow velocity and depth. The value of x at Twx equals 0 deg C is taken as the length of the ice-free reach. Q* is the sum of heat losses due to evaporation, convection, long- and short-wave radiation, and other processes, each of which is evaluated by an empirical or theoretical expression. The two principal limitations in accurately calculating downstream temperature changes are related to difficulties in evaluating the degree of lateral mixing in natural rivers and the convective and evaporative heat losses under unstable atmospheric conditions. Observations of lengths of ice-free reaches on the Mississippi River are in good agreement with the calculated values. Significant portions of the St. Lawrence Seaway can be kept ice-free by the installation of nuclear reactors at appropriate locations. (Shin-Vanderbilt)

DETERMINATION OF FEEDING CHRONOLOGY IN FISHES,
Marquette Univ., Milwaukee, Wis. Dept of Biology.
Rezneat M. Darnell, and Richard R. Meierotto.
Transactions of the American Fisheries Society, Vol 91, No 3, p 313-320, July 1962. 2 fig, 4 tab, 20 ref.

Descriptors: *Bullheads, *Fish food organisms, *Food habits, *Methodology, Crustaceans, Detritus, Insects.
Identifiers: *Digestive rates, *Ictalurus melas, Hyalella azteca, Stomach analyses.

A method is presented for determining the 24-hour chronology of feeding intensity of fishes, based on periodic stomach sampling and digestive rate studies involving a standard food item, Hyalella azteca. The method is applied to a natural population of young black bullheads. Based on 3-hour collection intervals, two feeding peaks were found: a major peak occurring just before dawn and a secondary peak occurring shortly before dark. Data on food habits, expressed as percentage of total volume are: amphipods 54.1, insect larvae 19.2, organic detritus 15.1, insect adults 4.5, algae and fungi 3.4, juvenile crayfish 2.8. Tabular data include results of stomach analyses and calculated food volumes for 3-hour collection periods. (Voigtlander-Wis)

Descriptors: *Fish food organisms, *Food ha *Iowa, *Yellow bass, Amphipoda, Crustacean sects, Zooplankton, Eutrophication.
Identifiers: *Clear Lake, *Diurnal period Iowa, Entomostraca, Immature insects, Odona

Yellow bass are a dominant member of the fauna of eutrophic Clear Lake. Stomach ana of fish collected by gill netting indicated that y yellow bass fed on the following (percen frequency of occurrence): Copepoda Cladocera 50.7, Chronomidae 30.7, Hyalella In terms of bulk (volume, estimated but not sured) food organisms appeared in the same of importance. Similar analysis of stomach older yellow bass yielded: immature insects Cladocera 43, Hyalella 12, and Copepoda frequency of occurrence. Adult insects and fish were of incidental importance. Among im ture insects, Diptera, mostly chironomids, most important (71%). Comparison with prev studies (two, four and five years earlier) indi increasing importance of immature insects, cially chironomid larvae, and decreasing portance of crustacean zooplankton. Yellow showed a diurnal feeding periodicity, with p observed at 6 p.m. and 8 a.m. Fish activity, ferred from gill-net catches indicated greates tivity between 6 p.m. and 4 a.m. (Voigtlander-

EXPERIMENTS ON THE DISSOLVED OXY REQUIREMENTS OF COLD-WATER FISHI
Oregon State Univ., Corvallis. Pacific Coope Water Pollution and Fisheries Research Labs.
Robert C. Davison, Wilbur P. Breese, Charles Warren, and Peter Doudoroff.
Sewage and Industrial Wastes, Vol 31, No 950-966, August 1959. 2 fig, 4 tab, 17 ref.

Descriptors: *Cold water fish, *Dissolved ox *Oxygen requirements, Laboratory Tests, Sal Sculpins, Sulfite liquors.
Identifiers: *Coho salmon, Feeding studies, O hynchus kisutch, Cottus perplexus.

Dissolved oxygen requirements of juvenile salmon and sculpin were determined under e mental conditions of flowing water and cont temperature. Experiments performed in showed no appreciable changes in minimu ygen concentrations (1.1–2.1 milligrams tolerated for one day between 12-20 deg (tolerance was reduced as upper thermal lim approached (25 deg C). In summer and fall, a stant temperature (20 deg C), salmon tolerat one day oxygen concentrations below 2 grams/liter but succumbed at 1 milligram Feeding experiments at 18 deg C and oxyge centrations of 2, 2.9, and 9 milligrams/lit dicated a weight loss due to sluggishness an feeding at 2 milligrams/liter oxygen, and ga weight of 28 and 42% at 2.9 and 9 milligram respectively. Addition of 1200 milligram sulfite liquor had no appreciable effect on requirements, but authors state results are n clusive. Tests on sculpin indicate no differe oxygen requirements, but capacity for acclim tion may be less. Figures include diagram of paratus. Tabular data include results of varia ygen concentrations, feeding studies and liquor tests. (Voigtlander-Wis)

EFFECT OF TEMPERATURE, SEDIMENT, FEEDING ON THE BEHAVIOR OF FOUR IONUCLIDES IN A MARINE BENTHIC PHIPOD,
on State Univ., Corvallis. Dept. of Oceanog-y.
A. Cross, John M. Dean, and Charles L. rberg.
lable from Clearinghouse for Sci and Tech In-ation as CONF-670503. Symp on Radioecolo-roc 2nd Natl Symp, May 15-17, 1967, Ann Ar-Mich. Nelson, Daniel J and Evans, Francis C). US Atomic Energy Comm, Doc CONF -03, pp 450-461. 4 fig, 4 tab, 48 ref, disc.

Descriptors: *Radioisotopes, *Amphipoda, *Benthic fauna, *Marine animals, *Temperature, *Sediments, Cycles, Zinc radioisotopes, Oregon, Sea water, Radioactivity, Gamma rays, Spectrometers, Tagging, Brine shrimp, Trophic level, Feeding rates, Washington.
Identifiers: *Radionuclide uptake, Anonyx, Cerium-144, Chromium-51, Scandium-46, Biological half-life, Species, Hanford Atomic Operation, Washington, Effective half-life, Molting, Exoskeleton.

Laboratory studies were conducted to determine effects of temperature, feeding, and presence of sediments on behavior of zinc-65 (Zn-65) in a gammarid amphipod (Anonyx sp) captured off the Oregon coast. In feeding experiments, cerium-144, (Ce-144), scandium-46 (Sc-46), and chromium-51 (Cr-51) were used in addition to Zn-65. Accumulation and elimination rates of Zn-65 were temperature dependent, although the effect appeared minimal within this organism's seasonal temperature range. Individual differences in Zn-65 accumulation rates for amphipods of similar size had a mean standard deviation range of 14-19%. Elimination rates of Zn-65 were increased in presence of sediment and were significantly greater in feeding than in nonfeeding amphipods. Anonyx, which fed on adult Artemia labeled simultaneously with Zn-65, Ce-144, Sc-46, and Cr-51, retained 55% of the Zn-65 and less than 10% of the Ce-144 and Sc-46. Transfer of Cr-51 was not measurable. Zn-65 loss during molting depended upon whether the zinc had been accumulated from food or water. When uptake was from water, approximately 20% of the Zn-65 body burden was lost with the cast exoskeleton, whereas only 2.0% was lost when Zn-65 was accumulated from food. The potential role of Anonyx in radioactivity cycling in marine environments is discussed. (See also Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

ELIMINATION OF IODINE, COBALT, IRON, AND ZINC BY MARINE ZOOPLANKTON,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
Edward J. Kuenzler.
Available from Clearinghouse for Sci and Tech Information as CONF-670503. Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich. Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, p 462-473. 2 fig, 6 tab, 21 ref, disc.

Descriptors: *Marine animals, *Zooplankton, *Iodine radioisotopes, *Cobalt radioisotopes, *Iron, *Zinc radioisotopes, Fallout, Nuclear explosions, Tracers, Copepods, Ecology, Radioactivity, Pacific Ocean, Indian Ocean, Atlantic Ocean, Sea water, Temperature, Resins, Ion exchange, Gamma rays.
Identifiers: *Elimination rates, Pyrosoma verticillatum, Cyclosalpa pinnata, Sagitta enflata, Sagitta hexaptera, Euphausiids, Pteropods, Chaetognaths, Heteropod, Neocalanus gracilis, Pleuromanna xiphias, Pleuromamma abominalis, Candacia ethiopica, Euchirella, Euchaeta marina, Salpa cylindrica, Salpa fusiformis, Thysanopoda tricuspidata, Crab megalops, Cavolinia inflexa, Euclio pyramidata, Cuvierina columnella, Carinaria lamarcki, Scaeurgus unicirrhus, Beroe ovata, Scaler, Scintillation crystal, Analyzer, Comparative physiology, Biogeochemistry.

Measurement of elemental elimination rates were made using zooplankton labeled by fallout from nuclear test and with tracers. Rates depended on element, species, and time since labeling. In experiments performed soon after labeling, copepods had elimination rates of 1-6%/hour for iodine (I), 4-6%/hour for cobalt (Co), and about 1%/hour for zinc (Zn), Pyrosoma, about 1%/hour for I and Zn, and 2-3%/hour for Co and iron (Fe); salpidae, 8-19%/hour for Co; Sagitta, 22%/hour for I, 11%/hour for Co, and 3%/hour for Zn; euphausiids, 1%/hour for I and Co, and 5%/hour for Zn; pteropods, 5-6%/hour for I and Fe, and 1-3%/hour for Co and Zn. Filtration and ion-exchange techniques indicated the physical and chemical form of eliminated products: most iodine was probably anionic but copepods eliminated some cationic; much iron was particulate; significant amounts were soluble anionic or non-exchangeable; some cobalt was particulate; most was cationic, zinc was frequently particulate, but also exchangeable and non-exchangeable. (See also Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

SORPTION OF RADIOACTIVE NUCLIDES BY SARGASSUM FLUITANS AND S NATANS,
Texas A and M Univ., College Station; and Kansas Univ., Lawrence.
John E. Simek, J. A. Davis, C. E. Day III, and Ernest E. Angino.
Available from Clearinghouse for Sci and Tech Information as CONF-670503. Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich. Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, p 505-508. 2 fig, 5 ref. disc.

Descriptors: *Radioisotopes, *Algae, *Sorption, Absorption, Gulf of Mexico, Atlantic Ocean, Radioactivity, Gamma rays, Potassium radioisotopes, Manganese, Cesium, Radium radioisotopes, Uranium radioisotopes.
Identifiers: *Sargassum fluitans, *Sargassum natans, Seaweed, Zirconium-95-niobium-95, Prebomb material, Ruthenium-106-rhodium-106, Ruthenium-103-rhodium-103, Cerium-144-praseodymium-144.

Sargassum natans and S fluitans, free-floating marine algae, can effectively concentrate certain radionuclides. In the evaluation of radionuclides found associated with these two species, an answer was sought as to the manner of this association. Floating samples were collected from the Gulf of Mexico and from North Atlantic areas. An analysis of Sargassum material collected prior to 1940 (prebomb) provided a positive means of comparing the activity added to the spectrum by nuclear activity. Tests utilizing acid, base, and neutral washes, were devised to determine whether adsorption or absorption was the major nuclide-plant association. Washington with uncontaminated, doubly distilled water, resulted in removal of only small amounts of potassium-40 (K-40), probably due simply to a washing out of sea salts. Separate, short term (up to 1 hour) washed of samples with slightly acidic and basic solution failed to indicate any activity other than that of K-40. However, acid and base washes for 24 hours produced definite evidence of activity; over this period, breakdown of the plant material became obvious. Results suggest that radionuclides in question are absorbed, or metabolically fixed, rather than adsorbed to Sargassum natans and S fluitans. (See also Vol. 2, No. 18, Field 5C, W69-07441). LIBRARY U. OF L. URBANA-CHAMPAIGN

Qualitative and quantitative information on stable elements contained in organisms and their environment is essential in predicting distribution patterns of artificially introduced radioisotopes of the same elements. Little is known of the distribution and variability of various elements and their radioisotopes within species of marine organisms sampled from the same area at a given time. To study their transfer through food webs and to evaluate concentration factors at each level, trace amounts of the elements copper, iron, and zinc, were determined in longnose anchovy (Anchoa lamprotaenia Hildebrand) and in alga (Udotea flabellum Lamouroux) from La Parguera and Joyuda, Puerto Rico. Levels of cobalt, copper, iron, manganese, nickel, and zinc in Atlantic thread herring (Opisthonema oglinum LaSueur) from La Parguera, were also determined. Analyses were accomplished with atomic absorption spectroscopy. Concentrations of the elements in individuals of the same species sampled within the same locality at the same time did not approximate normal distribution; however, distributions of the log-transformed concentrations closely approximated a normal curve in most cases. With expanded nuclear technology, radioisotopes in the environment may approach levels for which knowledge of the distribution patterns of these materials will be of primary importance. (See also Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

PHOSPHORUS TURNOVER BY CORAL REEF ANIMALS,
Georgia Univ., Athens. Dept. of Zoology; and North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
L. R. Pomeroy, and E. J. Kuenzler.
Available from Clearinghouse for Sci and Tech Information as CONF-670503. Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, pp 474-482. 1 fig, 3 tab, 34 ref, disc.

Descriptors: *Phosphorus, *Coral, *Reefs, *Marine animals, Fish, Ecosystems, Cycling nutrients, Temperature, Light quality, Chlorophyll, Zooplankton, Algae, Polychaeta, Crustacea, Mollusca, Echinodermata, Pacific Ocean.
Identifiers: Eniwetok Atoll, Turnover time, Tridacna crocea, Woods Hole Oceanographic Institution, Acropora hyacinthus, Pocillopora eydouxi, Porites lobata, Leptastrea purpurea, Fungia fungites, Zooxanthellae, Acanthurus triostegus, Conus ebraeus.

Coral reefs are particularly interesting ecosystems in which to study nutrient cycling, because of their great diversity of life and their high rates of organic production in a nutrient-depleted environment. Phosphorus (P) content and elimination rates were measured for dominant reef animals at Eniwetok Atoll, and flux of P through the organisms was expressed as turnover time. Herbivorous fishes appear to receive in their diet just enough P for growth and reproduction; this is reflected in a somewhat lower excretion rate and longer turnover time than would be predicted for organisms of their size, particularly the juveniles. Carnivorous animals and deposit feeders receive excess P in their diet, and their turnover time does not differ from ecosystems with a more abundant P supply. Of 5 species of reef corals examined, 4 showed a very long turnover time and little flux of P to the environment. Tridacna crocea showed a typical turnover time for a mollusc of its size, but seemed to lose most P via incorporation in living zooxanthellae, which are subsequently lost. This sampling of the flux of P is necessarily incomplete although organisms known to be dominant have been selected for study. (See also Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

ACCUMULATION OF FALLOUT RADIOISOTOPES BY BIVALVE MOLLUSCS FROM THE LOWER TRENT AND NEUSE RIVERS,
Bureau of Commercial Fisheries, Beaufort, N. C. Radiobiological Lab.
Douglas A. Wolfe, and Claire L. Schelske.
Available from Clearinghouse for Sci and Tech Information as CONF-670503. Symp on Radioecology, Proc 2nd Natl Symp, May 15-17, 1967, Ann Arbor, Mich, Nelson, Daniel J and Evans, Francis C (eds). US Atomic Energy Comm, Doc CONF 670503, p 493-504. 5 fig, 2 tab, 24 ref, disc.

Descriptors: *Fallout, *Radioisotopes, *Mollusks, *North Carolina, Gamma rays, Radioactivity, Spectrometers, Salinity, Cesium, Manganese, Zinc radioisotopes, Nuclear explosions, Cycling nutrients, Strontium radioisotopes, Aquatic populations, Estuarine environment, Sea water, Trace elements, Fresh water, Rainfall, Potassium radioisotopes, Cobalt radioisotopes, Radium radioisotopes.
Identifiers: *Trent River, *Neuse River (N C), Elliptio complanatus, Rangia cuneata, Polymesoda caroliniana, Ruthenium-106, Ruthenium-103, Cerium-144, Cerium-141, Zirconium-95-niobium-95, Barium-140-lanthanum-140, Chinese nuclear tests, Half-life, Biological concentrators, Anodonta cataracta, Anodonta imbecillis, Lampsilis cariosa, Congeria leucophaeta, Macoma phenax, Radionuclide accumulation, Biogeochemistry.

Bivalve molluscs are useful indicators of distribution of fallout radioisotopes in an aquatic environment. Three species of filter-feeding molluscs, Elliptio complanatus, Rangia cuneata, and Polymesoda caroliniana, were collected from stations in the Trent and Neuse Rivers in Eastern North Carolina at intervals for more than a year. Soft tissues of each species were ashed and analyzed for gamma radioactivity with a multichannel spectrometer (4 x 4-inch sodium iodide crystal). Concentrations of gamma-emitting fallout radioisotopes were monitored in Rangia over a 30-mile stretch of river and a salinity range from less than 0.1 to greater than 15 parts per thousand. Ruthenium-106, cerium-144, cesium-137, manganese-54, and zinc-65 were present in all samples. After Chinese nuclear tests in May and December 1966, the amounts of cerium-141, ruthenium-103, zirconium-95, niobium-95, and barium-140-lanthanum-140 rose suddenly in the samples. Ruthenium-106 and ruthenium-103 were more concentrated in Rangia from downstream stations (salinity range 6-15 parts per thousand), whereas cesium-137 was more abundant in the same species from fresher water (salinity range 0-8 parts per thousand). Zirconium-95-niobium-95 from the Chinese test in May remained in Rangia from freshwater stations after it was no longer detectable in the same species collected downstream. (See also Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)

Zooplankton are significant agents in cyclir
cobalt in sea surface layers and in its tran
through the termocline. Net hauls in eastern P
Ocean in spring 1962 showed that, over the w
day, mean biomass (wet weight) in the upper
meters was 3.87 grams/100 cubic meters, of w
42% were copepods, 13% pyrosomas,
siphonophores, 11% salps and doliolids, and
were chaetognaths. Diurnally migrating zoopl
ton amounted to 4.16 grams/square meter, co
ing of 22% copepods, 19% pyrosomas,
siphonophores, 18% salps and doliolids,
medusae, and 4% chaetognaths. Using data
literature on cobalt content of zooplankton, o
water and measured values of zooplankton
elimination rates, turnover time for cobalt i
upper 100 meters was calculated to be abo
years. Similarly, diurnally migrating zoopla
carry down and eliminate below the thermoc

tity of cobalt equal to that in the upper 100
rs, in about 56 years. Transport of cobalt
igh the termocline by migrating zooplankton
often equal or exceed transport by vertical
diffusion. (See also Vol. 2, No. 18, Field 5C,
-07441). (Jones-Wis)

fic salmon, Oncorhynchus spp, concentrate
ain gamma-emitting radionuclides--zinc-65
-65, manganese-54 (Mn-54), potassium-40,
cesium-137 (Cs-137)--in their viscera. In some
s, pattern of radionuclide concentration seems
ted to position of the Columbia River fresh-
r plume, a well-known source of Zn-65 in the
heast Pacific Ocean. Fishes whose migration
s were far south of the river had more Zn-65,
less Mn-54. Salmon in southeastern Alaskan
rs displayed a distinct difference in relative
ndance of Zn-65 and Mn-54. Manganese-54
dominant isotope in salmon of northern Alskan
rs and Zn-65 was more prominent in fish from
adian and contingent United States waters. The
mbia River plume undoubtedly accounted for
ease in Zn-65. Concentrations of radionuclides
r with species and stocks. Chinook and coho,
h feed more on small fishes than the sockeye,
mulated the highest concentrations of Zn-65,
54, and Cs-137. Sockeye, feeding on a lower
hic level, had low radioactivity, with Mn-54 the
inant radionuclide, some Zn-65, and no Cs-
Chum and pink salmon most nearly resembled
sockeye in radioactivity. Ocean food habits and
ratory pathways both appear relevant to levels
rtificially produced gamma-emitters in salmon
era. (See also Vol. 2, No. 18, Field 05C, W69-
41). (Jones-Wis)

River, Radioisotopes, Gamma rays, Spectrome-
ters, Benthic fauna, Depth, Distance, Ecology, Discharge (Water), Washington, Ecosystems, Bathymetry, Continental shelf, Continental slope, Sampling, Radioactivity, Detritus, Iron, Surface waters, Plankton, Nekton.
Identifiers: *Echinoderms, Hanford (Wash), Ocean bottom, British Columbia, Cascadia Abyssal Plain, Detector, Parastichopus californicus, Luidia foliolata, Pseudarchaster dissonus, Lophaster furcilliger, Zoroasteridae, Thrissacanthias penicillatus, Hymenaster, Heterozonias alternatus, Solaster borealis, Nearchaster aciculosus, Asteroids, Ophiura sarsii, Brisastér latifrons, Allocentrotus fragilis, Ctenodiscus crispatus, Paelopatides, River plume.

Role of benthic invertebrate organisms in determining fate of certain radionuclides in oceanic bottom has been studied. Artificial radionuclides, induced in water used as coolant in the Hanford reactors, are discharged into the Pacific Ocean by the Columbia River. Radionuclides from atmospheric atomic testing have also been detected in the environment. Gamma-ray spectrometric measurements show that levels of zinc-65 (Zn-65) decrease in both sediments and benthic animals with distance from the river mouth and with water depth. Although Zn-65 decreases rapidly in animals below 400 meters, it was detected to 2900 meter depths in animals, but not in sediments. Levels of Zn-65 in benthic animals appear to be associated with depth, distance from the point source, position of the Columbia River plume in the surface waters, and ecology of organisms. Bottom fauna is considered important in determining distribution of induced radionuclides. Some animals filter bottom water for food, while others ingest large quantities of sediment with associated organic materials. Marine organisms constantly remove certain elements from their environment, concentrating them in their tissues. There are intraspecific and interspecific variations in concentrations of Zn-65 in bottom organisms. (See also Vol. 2, No. 18, Field 5C, W69-07441). (Jones-Wis)
W69-08531

WARM-WATER IRRIGATION: AN ANSWER TO THERMAL POLLUTION,
Eugene Water and Electric Board, Oreg.
Luther J. Carter.
Science, Vol 165, No 3892, p 478-480, Aug 1969. 3 p.

Descriptors: *Waste water disposal, *Irrigation, *Heated water, *Thermal powerplants, Nuclear powerplants, Irrigation water, Water temperature, Waste water (Pollution), Cooling water.
Identifiers: Warm water irrigation.

The use of warm water for irrigation as a means of disposing of nuclear powerplant effluents is being studied in 2 projects in Oregon. The effects of warm water is controlling frost, lengthening the growing season, and stimulating plant growth are being evaluated. Water supply pipes buried in soil will supply both soil heat and irrigation water. Preliminary results suggest improvement in strawberry, string bean, and corn yield, but no differences in alfalfa, soybeans, and lima beans. (Knapp-USGS)

THERMAL DISCHARGES REQUIRE ADVANCE PLANNING,
Battelle-Northwest, Richland, Wash. Water Resources Systems Section.
R. T. Jaske.
Ind Water Eng, Vol 6, No 7, pp 18-21, July 1969. 4 p, 3 fig, 5 ref.

Descriptors: *Thermal powerplants, *Thermal pollution, Networks, Heated water, Systems analysis, Model studies, Path of pollutants, Water pollution effects, Pollution abatement, Planning.
Identifiers: Thermal discharge planning.

Careful planning of nuclear powerplant locations and methods of handling of thermal discharges is necessary to prevent harmful thermal pollution. In general, the impact area of 1,000 MW production is about 5 1/2 sq mi. This corresponds to river lengths of about 10 mi on large, slow-moving streams, and much longer lengths on smaller and faster rivers. Mixing zones may be thermal barriers to fish movement. Although thorough mixing lengthens the impact area, minimizing the initial temperature differential is of greater value than maximizing heat loss rates by using high differential temperatures. The presence of dams changes the thermal regime, but the effect must be studied on the basis of individual cases. It is possible to regulate thermal regime by dams so as to permit construction of more powerplants than the unregulated stream could support, but this is practical only on large streams. The use of cooling towers allows greater freedom of plant location. Model studies may be used to calculate effects of plant distribution, networks, cooling, regulation, and economic factors. W69-08564

BIOLOGICAL CONCENTRATION OF PESTICIDES BY ALGAE,
North Texas State Univ., Denton. Dept. of Biology.
B. Dwain Vance, and Waymon Drummond.
J Amer Water Works Ass, Vol 61, No 7, p 360-362, July 1969. 3 p, 2 tab, 11 ref. Grant No CC00269 (PHS).

Descriptors: *Pesticide residues, *Algae, Bioassay, Bioindicators, Fishkill, Hazards, Pesticide kinetics, Pesticide toxicity, Pollutants, Water pollution effects, Aldrin, Dieldrin, Endrin, DDT.
Identifiers: Pesticide bioaccumulation.

Algae, the base constituents of the aquatic food chain, concentrate pesticides and are much more resistant to toxic effects than the higher organisms that eat them. Algal cultures were grown in the presence of DDT, aldrin, dieldrin, and endrin, in concentrations of 5-20 microgram per ml. The algae concentrated the pesticides 100 times or more in all the tests. The data are tabulated. Practically no degradation of the pesticides occurred. (Knapp-USGS)

LABORATORY INVESTIGATION OF THE EFFECTS OF THERMAL ADDITIONS ON MARINE ORGANISMS CHARACTERISTIC OF CAPE COD CANAL,
Sandy Hook Marine Lab., Highlands, N. J.
J. B. Pearce, M. Silverman, and R. Le Goff.
Sandy Hook Marine Lab Final Rep, Mar 1968. 21 p, 5 fig, 5 tab, 19 ref.

Descriptors: *Thermal pollution, *Water pollution effects, *Biological communities, Thermal powerplants, Water temperature, Fishkill, Fishing, Fish management, Cold-water fishing, Sport fishing, Commercial fishing.
Identifiers: *Cape Cod Canal (Mass).

Studies were made to predict the effects of thermal pollution on commercial fish and shellfish in Cape Cod Canal, Massachusetts. Suggestions are made for profitable uses of the heated waters. Tank and flume experiments showed that water temperatures approaching 77 deg F affect many of the fish and invertebrates in the canal. Winter flounder, one of the important sport fishes, are killed by 77 deg water. Other fish are somewhat more tolerant of high water temperatures. (Knapp-USGS)

RATIONALE OF STANDARDS FOR USE OF RECLAIMED WATER,
California State Dept. of Public Health, Berkeley. Bureau of Sanitary Engineering.
Herbert B. Foster, Jr., and William F. Jopling.
ASCE Proc, J Sanit Eng Div, Vol 95, No SA3, Pap 6609, pp 503-514, June 1969. 12 p, append.

Descriptors: *Water reuse, *Reclaimed water, *Standards, *Water quality, *California, Waste water treatment, Tertiary treatment, Sewage treatment, Legislation, Regulation.
Identifiers: Reclaimed water standards (Calif).

California has established standards for reclaimed wastewater used for crop and landscape irrigation and recreational impoundments. Insofar as possible the standards avoid the use of specific quality parameters in order to minimize monitoring requirements which would be burdensome to small operations. The major exception is that, where a disinfected reclaimed waste water is necessary, daily coliform bacteria analyses are required. This requirement was one of 4 major controversial points which are presented. Other major points raised in the development of standards are specification of operational controls and practices in the production and use of reclaimed waste water, and quality requirements for the various uses. (Knapp-USGS)

TREATMENT OF HIGH NITRATE WATERS,
Federal Water Pollution Control Administration, Fresno, Calif. San Joaquin Project; and Stanford Univ., Calif. Dept. of Environmental Engineering.
Percy P. St. Amant, and Perry L. McCarty.
Amer Water Works Ass 89th Annu Conf, May 21, 1969, San Diego, Calif, 1969. 18 p, 2 fig, 3 tab, 5 ref.

Descriptors: *Waste water treatment, *Denitrification, *Anaerobic conditions, Anaerobic bacteria, Filtration, Porous media, Aeration.
Identifiers: Anaerobic filtration treatment.

Biological denitrification was investigated as an economically feasible way to remove nitrates from waters to control discharge of nutrients into bodies of water. Pilot-plant studies conducted to estimate chemical requirements, to evaluate anaerobic filter media, and to determine the operating parameters of the anaerobic filtration process. Biological denitrification in anaerobic filters is a reliable process for removing excess nitrates from water supplies. An organic electron donor must be added to accomplish dentrification and methanol has been found to be a satisfactory and inexpensive material for this purpose. Use of one-inch gravel filter media and a detention time of one hour is sufficient for 90% or greater removal of approximately 20 mg/l of nitrate-nitrogen in water with temperature of 12 deg C and above. Costs, operating characteristics, and filter design data are tabulated. (Knapp-USGS)
W69-08228

RETURN FLOWS: A REUSABLE WATER RESOURCE,
Texas Water Development Board, Austin.
John J. Vandertulip.
Water Reuse, Amer Inst Chem Eng Progr Symp, Ser No 78, Vol 63, pp 106-109, 1967. 4 p, 1 tab.

Descriptors: *Water reuse, *Reclaimed water, *Return flow, *Water sources, *Recirculated water, *Water quality, Water quality control, Water pollution control, Sewage treatment, Water quality Act, Industrial wastes, Municipal wastes, Water treatment, Water law, Water management (Applied).
Identifiers: Return flow reuse.

Return flows from various types of water uses constitute an important water resource to be evaluated in water planning. Benefits of increased quantities of available water may be offset by quality deterrents of pollutants. Industrial reuse of water by treatment or recirculation may offer a favorable economic solution to increased water requirements. Water resources planning, water quality management, and interagency coordination are essential factors in a regional approach to development of water resources and the effective integration of return into regional development analysis and water administration. ntifiers: *Grand Canyon.

This paper traces water problems and wastewater reuse at the south rim of the Grand Canyon from the late 1800's to the present. Reclamation efforts began in 1924 with construction of an activated sludge plant supplemented by an anthracite coal filter and chlorination. Treated water was used for toilets, boiler feed water, cooling water and irrigation. Treatment cost of $0.59/1,000 gal. compared favorably to railroad transported water at $3.09/1,000 gal. Additional water was pumped up from Indian Gardens in 1934. Detailed records of cost have been kept by the National Park Service since 1951. Presently, construction of a pipeline from Roaring Springs, on the more water rich north rim, presents the possibilities of abandoning the water reuse system, constructing newer facilities, or continuing the 40-year old plant. Whatever the future, the plant at Grand Canyon has demonstrated that wastewater reuse is an economically sound concept. (Sherbrooke-Ariz)

RENOVATION OF WASTE WATER THROUGH APPLICATION TO AGRICULTURAL CROPLAND AND FORESTLAND,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
Louis T. Kardos, and Earl A. Myers.
Institute for Research on Land and Water Resources, Research Project Technical Completion Report, University Park, Pa., June 1969. 6 p, 3 append. OWRR B-001-PA.

Descriptors: *Sewage effluents, *Wastewater, *Surface runoff, *Subsurface runoff, *Nitrates, Infiltration, Percolation, Soil water, Nitrites, Ammonium compounds, Maganese, Iron, Nitrification.
Identifiers: *Soil aeration, *Oxygen diffusion rate, *Suction lysimeter, Piezometer head, Artesian.

Hydrologic studies on two soil sites indicate that soil permeability can be a highly critical control of hydraulic acceptance of sewage effluent waste water applied to a sloping disposal area. Variations in vertical permeability of the soil resulted in perched water tables and artesian phenomena, with interflow appearing downslope as surface runoff. Total surface runoff ranged from 0 percent of the waste water application during periods of high evapotranspiration to 100 percent on frozen, ice-coated soil. The cycling of effluent application at weekly intervals permitted the soil to remain aerobic as measured by oxygen diffusion rates and gaseous oxygen concentration in the soil profile to a depth of 24 inches. The aerobic condition was reflected in the presence of nitrate as the dominant form of nitrogen in the soil water samples obtained from suction lysimeters at the 6-and 24-inch depth. Nitrite concentrations were generally less than 0.05 mg per liter, and manganese and iron concentrations in the effluent-treated area were not significantly different from those found in the control area. (Pollard-Penn State University)

SURVIVAL AND ACTIVITY OF SEWAGE MICROORGANISMS IN ACID MINE WATER,
West Virginia Univ., Morgantown.
Raymond C. Kralovic, and H. A. Wilson.
Water Research Institute Research Report 1, 1969. OWRR Project A-002-WVA.

Descriptors: *Acid mine water, *Sewage, *Yeasts, *Microorganisms, Microbiology, Biochemical oxygen demand, Hydrogen ion concentration.
Identifiers: *Acid-tolerant bacteria, Oxygen utilization.

Numbers and types of bacteria decrease if the pH of sewage is lowered by addition of acid mine water. A rapid decrease occurs at 4 C and 22 C microbial numbers increase after the initial decrease. The biochemical oxygen demand (BOD) of sewage and acid-mine-water mixtures decreases as the pH of the mixture decreases. At pH 3.5, there is a lag period before much biochemical oxidation occurs. Oxygen utilization is greater if yeasts are inoculated into a sterile sewage and acid-mine-water mixture than when bacteria are used. If together, utilization is greater than for either alone. Qualitative and quantitative microbial estimations were made on Monongahela River water which contains domestic raw sewage and acid mine water. Yeasts were the dominant organisms if the plating medium was at pH 4.0, and bacteria were dominant if the medium was about pH 7.0. The actually acid-tolerant bacteria that will grow in sewage and acid-mine-water mixtures at pH 4.0 probably represent only a few genera. Four such isolates were identified as Bacillus species. Other isolates were identified as Micrococcus candidus and Kurthia variabilis. (Wilson-W Va)
W69-08400

AN INVESTIGATION OF POTENTIAL INTERACTIONS OF COAL AND COAL PRODUCTS FOR USE IN THE TREATMENT OF MINE DRAINAGE WATERS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
Harold L. Lovell, and James L. Sloughfy.
Institute for Research on Land and Water Resources, Research Project, Technical Completion Report, University Park, Pa, June 1969. 176 p, 1 append, 23 tab, 23 fig. OWRR B-004-PA.

Descriptors: *Mine drainage water, *Acidity, *Neutralization, Coal, Treatment, Activated carbon, Ion, Water quality, Alkalinity, Ion exchange, Absorption, Temperature, Settling rates.
Identifiers: *Coal products, *Steam activation, Mineral matter, Sulphuric acid, Steam activation, Surface area, Reaction rates.

The potential for using coal or coal-products (including commercial activated carbon) for treating mine water was considered. Certain coals whose inherent mineral matter have the capacity to reduce acidity are being employed industrially. Acidity reduction by the organic phases of coal is nil. Coal products heated to 450 degree C in a nitrogen or steam atmosphere have a little acid-reduction response. Coal activated by steam at 800 degree C develops increased specific surfaces, including complex carbon oxides which have the ability to reduce acidity. The properties of such products and commercial activated carbons may have potential in treating these and other polluted waters. (Pollard-Penn State Univ)

Proc, Amer Soc Civil Eng, Vol 89, No SA5, p 1-30, Oct 1963. 30 p, 3 fig.

Descriptors: *Mathematical models, *Dissolved oxygen, *Optimization, *Waste treatment, *Systems analysis, Time series analysis, Sewage effluents, Streams, Digital computers, Analog computers.

A mathematical model was presented for describing time variations of dissolved oxygen (DO) in a finite number of sections in a body of water for optimal sewage treatment. The model, as presented in its general form, embodies all types of inputs and was capable of assessing the effects of any one time varying input in one section of the water body on the DO in any other section. Systems analysis techniques were employed and the DO response equations resulting from the imposition of general input forcing functions were derived. An analytical relationship was developed between the time variation of the sewage effluent in one section and the DO response in any other section. The dependent variable could assume the role of any water quality constituent. Although the systems techniques were general, the analytical model was presented for the case of an estuary without any analytical difficulties. Non-tidal streams were a special case of the general formulation. The model was capable of

OPERATIONS RESEARCH ACTIVITIES AT CINCINNATI WATER RESEARCH LABORATORY,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
Robert Smith.
Proc, Nat Symp Anal Water Resource Syst, p 241-260, Denver, July 1968. 20 p, 14 fig, 5 ref.

Descriptors: *Water resources, *Operations research, *Waste water treatment, *Mathematical models, *Planning, Design, Optimization, Control systems, Time, Stream improvement, Activated sludge.
Identifiers: Cincinnati Water Research Laboratory, Quasi steady state.

Operations research activities at the Cincinnati Water Research Laboratory were discussed. Operations research activities at CWRL were directed towards the development of mathematical models to represent the performance and cost of all practicable wastewater treatment processes, and the use of the information obtained for the advancement of planning, design and control of wastewater treatment. Two principal types of mathematical models were studied; the quasi steady state model and the time dependent model. The quasi steady state model was based on 24 hours composite measurements and was intended for planning and design of wastewater treatment systems to accomplish a specific treatment task at minimum cost. The time dependent model was used for the study of the practicability of various schemes for controlling processes which receive highly variable intermittent loads. It was concluded that by means of process control the variability of the effluent stream quality and the average performance of the process can be improved.

A TEST OF THE HYPOTHESIS THAT POLLUTION CONTROL IS WORTH WHAT IT COSTS,
Delaware Univ., Newark. Urban Affairs Div.
Robert F. Minnehan.
Proc, Water Resources Seminar 1967-1968, pp 19-52, Univ Del, Newark, Dec 1968. 34 p, 1 tab, 4 fig.

Descriptors: *Mathematical models, *Water quality control, *Pollution abatement, *Optimization, *Cost-benefit analysis, Waste water treatment, Economics, Biochemical oxygen demand, Water resources, Delaware River.
Identifiers: San Francisco Bay.

A benefit-cost mathematical model was developed for water quality evaluation in order to determine whether water pollution control is always worth what it costs and what is the optimal degree of waste reduction. The model's equations were then fitted with coefficients that approximated benefits and costs, with Delaware River Estuary and San Francisco Bay as examples. The results indicated that a high level of treatment is not justified when the total waste load is small in relationship to the assimilative capacity of the stream or adjacent watercourse. The results also indicated that although complete BOD removal is required to maximize net benefits in a heavily polluted river, the costs of waste treatment may exceed the benefits and the control program may not be justified economically. An evaluation of optimal treatment level revealed that the benefit cost ratio was an increasing and a decreasing function of BOD removal. With growth in the quantity of waste flow there may be a point in time where the benefits of pollution abatement will always be less than costs and optimal treatment increased as the quantity of waste flow increased. (Thiuri-Cornell)

TREATING WASTES IN A WATER-SHORT AREA,
Texas Technological Coll., Lubbock.
H. E. Clay.
Textile Chemist and Colorist, Vol 1, No 7, p 176/28-179/32, March 26, 1969. Based on a symposium, February 26-28, 1969, sponsored by A.A.T.C.C. and US Departments of Commerce and Interior.

Descriptors: *Water shortage, *Activated sludge, Biochemical oxygen demand, Chemical oxygen demand, Waste treatment, Aerobic treatment.
Identifiers: *Anaerobic contact process, Textile wastes.

The approach to, and results of, a laboratory study, designed to provide information on the treatability of concentrated wastes produced by textile mills operating in water short areas, are given. Because of high costs of water and scarcity of water in such areas, mill effluents contain very high concentrations of pollutants. Data on the characteristics of raw waste, operating results for activated sludge plant, and operating results for anaerobic contact process are discussed. It was concluded that highly concentrated textile wastes could be effectively treated by both aerobic and anaerobic processes with BOD reductions of 90%. The anaerobic control process is believed potentially better suited. (Livengood-NC State Univ)

Identifiers: *Recovery (Waste), Zinc sulphate, Dyeing wastes, Bleaching wastes, Dow surfpac filter, Clarifier.

This article discusses what has been done by seven textile companies to solve the pollution problem. American Enka has constructed three settling basins, an anhydrous sodium sulfate recovery plant, an extended aeration system, and a system for the removal of zinc sulfate from waste water. Detailed descriptions are given. The majority of Burlington Industries' plants employ a modified activated sludge system to treat their wastes. Cannon Mills' treatment plant employs primary settling basins, equalization tanks, aeration for dye wastes, caustic storage tanks for pH control and a two-stage trickling filter. A detailed description of Chatham Mfg. Co.s' aerated lagoon is given. A description of Cone Mills' biological treatment plant which employs high rate filtration, activated sludge and aerobic lagooning alone and in variation is given. Dan River Mills' employs an aerobic lagoon, an aerobic-anaerobic lagoon, a clarifier, an activated sludge basin, a Dow Surfpac filter, and a chemical precipitation unit. A description of M. Lowenstein and Sons' pumping station, screening facility, and basins are given. (Goodwin-NC State Univ)

ifiers: Salinity hazard.

rograms of irrigation with municipal waste ef-nts, the build-up of soluble salts, which can in-se the osmotic pressure of the soil solution, can revented by providing for adequate drainage by applying enough excess irrigation water to tain a favorable salt balance. In humid areas, ainy season is likely to provide the necessary ning. Even with good drainage and sufficient ning to remove normal amounts of soluble . it is possible to have an accumulation of angeable sodium and precipitated or adsorbed y metals that can adversely affect the soil and s. A build-up of salts is very much less likely e an effluent is used to supplement normal all in humid areas than if it is used in an arid ite where irrigation supplies the major portion ie water required for a crop. Relatively low entrations of sodium and chloride salts applied iliage can cause harmful salt build-up on sensi-crops. Boron is of special concern when ef-t is used for irrigation because the tolerance rinking water can be greater than for irriga-There is a great variation in the salt content of ge that reaches different treatment plants and derable variation in that reaching a given ment plant. These variations are reflected in ffluent. Some of the soluble metal salts are ved by precipitation or chelation during the ment process. Zinc is most readily removed by treatment and nickel the least. Short term irrigation trials with effluent may fail to reveal a build-up potential. Accumulations of heavy metals in soils constitutes a unique hazard because of inadequate methods for reclamation. (Knapp-USGS)

GROUNDWATER RECHARGE WITH TREATED MUNICIPAL EFFLUENT,
Texas Technological Coll. Lubbock. Water Resources Center; and Texas Technological Coll., Lubbock. Dept. of Engineering.
Dan M. Wells.
Symp on Munic Sewage Effluent for Irrig, July 30, 1968, Louisiana Polytech Inst, Ruston, p 61-73, 1968. 13 p, 1 tab, 46 ref. OWRR Proj No A-009-LA.

Descriptors: *Water reuse, *Reclaimed water, *Municipal wastes, *Artificial recharge, Legal aspects, Aesthetics, Aquifers, Soil water movement, Groundwater movement, Infiltration, Water chemistry, Water quality, Soil contamination.
Identifiers: Waste water recharge.

Municipal effluent has always been used for groundwater recharge. Practically all of the recharge in the past has been unintentional, resulting from the natural operation of the hydrologic cycle, and it does not appear that this pattern will be appreciably changed in the future. It does appear, however, that the deliberate use of treated effluent for groundwater recharge will increase in the future, particularly in arid and semi-arid areas of the country that are rapidly depleting their groundwater resources. Although the technological capability for treating municipal effluent for any type of reuse including the recharge of potable groundwater supplies has existed for many years, many psychological problems remain to be solved to win public acceptance for its widespread use. Physical problems include clogging of soils of aquifers, chemical precipitation, and algal or bacterial growth. The legal problems include liability for damages to aquifers, ownership of recharged water, and ownership of effluent water. (Knapp-USGS)

THE MOVEMENT OF DISEASE PRODUCING ORGANISMS THROUGH SOILS,
California Univ., Davis, Dept. of Civil Engineering.
R. B. Krone.
Symp on Munic Sewage Effluent for Irrig, July 30, 1968, Louisiana Polytech Inst, Ruston, p 75-104, 1968. 30 p, 2 fig, 55 ref.

Descriptors: *Water reuse, *Pathogenic bacteria, *Viruses, *Groundwater movement, Municipal wastes, Irrigation water, Artificial recharge, Filtration, Sorption, Infiltration, Percolation, Soil disposal fields, Soil contamination, Soil physical properties.
Identifiers: Municipal waste recharge.

The movement of pathogenic organisms through soils recharged with contaminated water is discussed. Pathogens have a wide variety of physical and biological characteristics, including wide ranges of size, shape, surface properties, and die-away rates. The processes of filtration by soil include straining at the soil surface, straining at intergrain contacts, sedimentation, and sorption by soil particles. Straining of pathogens at the soil surface and sorption of viruses near the soil surface is desirable because it limits travel of pathogens most, and it is subject to wide variations in temperature and moisture, and it will assure aerobic conditions. A soil containing clay should therefore be used for irrigation with treated sewage. Wide experience in irrigation with treated sewage indicates that it is safe provided that at least primary treatment is used, and provided that the crops are not consumed directly by humans. Secondary treatment and chlorination is recommended for aesthetic reasons. (Knapp-USGS)

A TECHNICAL AND ECONOMIC FEASIBILITY STUDY OF THE USE OF MUNICIPAL SEWAGE EFFLUENT FOR IRRIGATION,
Soil Conservation Service, Searcy, Ark.; and Louisiana Polytechnic Inst., Ruston. Dept. of Agricultural Engineering.
Robert P. Cantrell, Charles W. Wilson, F. E. Beckett, and F. A. Calvo.
Symp on Munic Sewage Effluent for Irrig, July 30, 1968, Louisiana Polytech Inst, Ruston, p 135-156, 1968. 22 p, 1 fig, 3 tab, 19 ref, append.

Descriptors: *Water reuse, *Reclaimed water, *Municipal wastes, *Irrigation water, *Costs, Economics, Water pollution control, Nutrients, Water costs, Water wells, Legal aspects.
Identifiers: Ruston (La).

A study of technical and economic feasibility of irrigation reuse of Ruston, La. municipal wastewater effluents show that there are no significant technical problems. Neither corrosion nor salinity hazard to crops is expected to cause severe problems. Sprinkler irrigation using waste water is safe for field crops and pasture but is not recommended for fruits and vegetables. Furrow irrigation of fruit trees, as long as effluent does not contact the fruit, is acceptable. The cost of using effluents compares favorably with costs of other water sources. For the farms studied, average annual cost was $54.82 per acre, compared with $105.87 per acre for well water. This did not account for the fertilizer value of the effluent, which was about $17.50 per acre-ft. (Knapp-USGS)

LIBRARY U. OF L. URBANA-CHAMPAIGN

AN ENGINEERING-ECONOMIC ANALYSIS OF SYSTEMS UTILIZING AQUIFER STORAGE FOR THE IRRIGATION OF PARKS AND GOLF COURSES WITH RECLAIMED WASTEWATER,
Nevada Univ, Reno. Dept. of Civil Engineering; and Nevada Univ., Reno. Center for Water Resources Research.
Richard G. Orcutt.
Desert Res Inst Tech Rep HW-5, Nev Univ, Oct 1967. 123 p, 17 fig, 12 tab, 47 ref, 3 append. OWRR Proj No A-008-NEV.

Descriptors: *Water reuse, *Artificial recharge, *Irrigation water, *Arid lands, *Nevada, Mathematical models, Systems analysis, Model studies, Hydraulic models, Transmissivity, Aquifers, Groundwater movement, Water yield, Water quality, Water storage, Sanitary engineering, Water pollution, Optimization, Economics.
Identifiers: *Hele-Shaw models, Las Vegas (Nev).

An engineering-economic model of systems utilizing aquifer storage for the irrigation of public parks and golf courses with reclaimed municipal wastewater was developed and a computer program for the production costs for these systems was written. One model criterion was the essentially complete recovery of the injected water from the aquifer. A sensitivity analysis studied the effects of varying the input parameters, which represented decision variables and constants with uncertain values, upon the cost of reclaimed water. Preliminary feasibilities were studied for selected sites in Las Vegas, Nevada. A Hele-Shaw model was used to estimate the amount of groundwater withdrawal for essentially complete recovery of the injected reclaimed water. The benefits which might be attributed to the relief of sewerage by wastewater reclamation systems in Las Vegas, Nevada, were estimated. The model rapidly determines the cost effect of varying about 40 input parameters. A significant finding is the important influence which the injection rate, particularly for rates under 0.75 cfs per well, has upon water cost. The successful development of reclamation-reuse systems utilizing aquifer storage will require close cooperation between the agency which is responsible for the project and public health agencies at all levels. A complete Fortran program listing for the mathematical model is included. (Knapp-USGS)

5E. Ultimate Disposal of Wastes

SEWAGE DISPOSAL SYSTEMS NEAR SHORELINES.

NH Rev Stat Ann secs 149-E:1 thru 149-E:8 (Supp 1967).

Descriptors: *New Hampshire, *Water pollution sources, *Sewage disposal, *Sewage treatment, Sewage, Legislation, Wastes, Municipal wastes, Water pollution control, Disposal, Environmental engineering, Waste water disposal, Shores, Shore protection, Administrative agencies, Planning, Land development, Soil contamination, Soil contamination effects, Jurisdiction, Legal aspects.

The purpose of this chapter is to prevent water pollution by inadequate waste disposal systems near shorelines. Anyone proposing to subdivide land or construct a sewage disposal system near any shoreline shall submit such plans for approval by the Water Supply and Pollution Control Commission. The disposal systems shall be constructed in accordance with the approved plans. The commission shall notify the person submitting plans of their approval or disapproval. No plans shall be required when the system will be connected to a public sewer system. The commission will require the submission of any soil data from any subdivision to be built. Anyone aggrieved by the decision of the commission may appeal in accordance with the established procedure. The commission shall be empowered to: (1) supervise and enforce this chapter; (2) employ necessary personnel; (3) adopt, after public hearings, rules and standards to implement this chapter; and (4) prohibit construction of any sewage system which would cause pollution. Upon certification by the commission, local officials may exercise concurrent jurisdiction with the commission in enforcing this chapter. Violations of these provisions shall be punishable by a fine and the acts may be enjoined. (Helwig-Fla)

STATUS OF RADIOACTIVE WASTE DISPOSAL IN U.S.A.,
Vanderbilt Univ., Nashville, Tenn. Dept. of Sanitary and Water Resources Engineering.
Frank L. Parker.
ASCE Proc, J Sanit Eng Div, Vol 95, No SA3, Pap No 6597, pp 439-464, June 1969. 26 p, 9 fig, 5 tab, 60 ref.

Descriptors: *Radioactive waste disposal, *Reviews, *Bibliographies, Systems analysis, Waste disposal, Injection wells, Monitoring, Regulation, Radiochemical analysis, Pollutant identification, Water pollution control.
Identifiers: Underground grouting (Disposal).

The present state of radioactive waste disposal practices is reviewed. The main emphasis in research in liquid radioactive waste management has been on the feasibility of conversion of liquids to solid form before disposal and in place underground, and monitoring of disposal and pollution effects. For gaseous wastes, the emphasis has been on the removal of the various forms of iodine in the off-gas systems and the development of new methods for noble gas removal. For solid waste disposal, better containment has been sought, and private burial operations have been transferred to commercial burial grounds. The management of radioactive wastes has not proven to be a deterent to a nuclear power economy. The major problems remaining are methods of the removal of noble gases and tritium, development of methods of fuel reprocessing, and understanding of the movements of radionuclides in the environment. . Water Quality Control

TER POLLUTION CONTROL.

USCA secs 466, 466-1, 466-a, 466-b, 466c pp 1969).

criptors: *Federal government, *Water pollu- control, *Water policy, *Pollution abatement, tement, Legislation, Water law, Legal aspects, ninistrative agencies, Water quality control, ninistration, Political aspects, State govern- nts, Local governments, Financing, Water pu- ation, Allotments, Economics, Grants, Model lies, Planning, Projects, Federal project policy, ject planning, Project purposes, Interstate com- ts.

ted States congressional policy contemplates enhancement of the quality and value of our na- al water resources through the prevention, con- , and abatement of water pollution. It is also eral policy to recognize and preserve the prima- responsibilities and rights of the states in venting and controlling water pollution through to them in technical research, services and ncing. Grants are available to state and local ernments to assist in the development of pro- s which demonstrate new or improved methods ontrolling the discharge into any waters of un- ted sewage, and development of advanced te treatment and water purification methods. Secretary of the Department of Health, Educa- and Welfare is to prepare and develop com- hensive programs for eliminating or reducing pollution of interstate waters and improvement the sanitary condition of surface and un- ground waters. He is partially advised in these ters by the Federal Water Pollution Control ministration. The secretary promotes interstate peration with respect to uniform state laws, e compacts, research, experiments, and studies may initiate investigations in a number of blem areas relating to water pollution. W ENGLAND INTERSTATE WATER POL- TION CONTROL COMPACT.
Stat Ann tit 10, secs 991-1002 (1958), as nded, (Supp 1968).

criptors: *Vermont, *Interstate compacts, ater pollution control, *New England Interstate S Compact, New England, Connecticut, Maine, sachusetts, New Hampshire, Rhode Island, York, Abatement, Interstate commissions, In- tate rivers, Interstate cooperatives, State rnments, Water policy, Standards, Water ity, Water pollution, Classification, Tidal rs.

states of New England join in this compact to e and control pollution in their interstate rs. The compact shall apply to waters contiguous to or flowing through two or more signatory states. Each signatory state shall be represented on the commission. The commission shall meet, conduct business, promulgate rules and make reports as required and as necessary for its purposes. The commission shall be financed by the signatory states and its records subject to audit by each member. The commission shall establish physical, chemical and bacteriological standards of water quality for the various classifications of water. Each signatory state will classify its interstate waters by use, subject to approval by the commission. Each state pledges to abate pollution in interstate inland and tidal waters. Nothing herein shall prevent any signatory state from imposing additional restrictions to further reduce pollution in its waters. The commission may cooperate with New York in pollution abatement of common waterways. The compact was adopted by Vermont on June 29, 1951. (Helwig-Fla)
W69-08151

LOCAL PROVISIONS.
SC Code Ann secs 70-311 thru 70-491 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Water districts, *Water distribution (Applied), *Cities, Boats, Lakes, River, High water mark, Low water mark, Swimming, Dams, Dikes, Canals, Reservoirs, Water conservation, Water control, Watercourses (Legal), Water resources development, Water pollution, Water pollution control, Water management (Applied), Water supply, Water wells, Public utilities, Wildlife, Domestic water, Easements.
Identifiers: Penalties (Criminal), Life preservers, Motor boats.

Regulations are promulgated for boating in various waters of the state. The carrying of life preservers and the use of motor boats are regulated. Authorization is given establishing several local water authorities. The authorities may construct reservoirs, dams, dikes, canals, tunnels, or whatever they deem necessary for the proper distribution of both domestic and industrial water. The terms and compensation of the authorities members are enumerated along with their specific powers. Among these are the powers to: (1) impound fresh water; (2) maintain water distribution systems; (3) protect the waters from pollution; (4) lease, sell or convey land; (5) exercise the power of eminent domain and; (6) borrow money and issue negotiable bonds. The authority may charge reasonable rates for its services. Other provisions are made for local water districts, and regulations are made regarding water diversion and well digging. (Shevin-Fla)
W69-08155

STATE BOARD OF HEALTH: WATER.

17 SC Code Ann 308-314 (1962).

Descriptors: *Water treatment, *South Carolina, *Domestic water, *Water quality control, Public health, Cities, Water supply, Engineering, Cesspools, Reservoirs, Water consumption, Water pollution, Chlorination, Chemical analysis, Bacteria, Biological treatment, Sewers, Flouridation, Construction, Pumping, Wells, Water works, Water sources, Tidal waters, Springs, Legislation.
Identifiers: Savannah River Project.

Regulations are promulgated for the establishment of any waterworks that will furnish water for domestic use. All plans for building or improving water purification plants or altering the water source supply shall be submitted for approval to the State Board of Health. The application must provide complete details of the proposals including estimates of the per capita consumption for the future and chemical and bacteriological analyses of the water source. Before being placed into service all new water distribution systems must be sterilized. The method of sterilization is set forth. No flourides may be added to the water supply unless approval is first obtained from the Board of Health. No water furnished for domestic use may contain impurities which may injuriously affect public health. Steps must be taken to amply protect the water sources from pollution. The area surrounding the Savannah River Project is designated an emergency area and is subject to certain special regulations in regards to water supply and sewage disposal. The tidal waters of the state are classified. (Shevin-Fla)
W69-08166

METROPOLITAN SANITARY DISTRICT OF GREATER CHICAGO V UNITED STATES STEEL CORPORATION (INDUSTRIAL WATER POLLUTION).

41 111 2d 440, 243 NE2d 249-252 (1968).

Descriptors: *Illinois, *Pollution abatement, *Water policy, *Water pollution control, Abatement, Judicial decisions, Water pollution, Legislation, Administrative agencies, Water quality control, Legal aspects, Water law, Impaired water quality, Pollutant identification, Riparian rights, Water pollution effects, Public rights, Potable water, Water purification, Filtration, Financial analysis, Costs, Lake Michigan.
Identifiers: *Injunctions.

PLAINTIFF, Metropolitan Sanitary District of Greater Chicago, was awarded a temporary injunction in the circuit court against defendant corporation restraining it 'from polluting waters of Lake Michigan by discharging any oil or oily substances into the waters' of the lake. The sanitary district alleged that such oil or oily substance was visibly floating on the surface of the lake. The circuit court found that an oil slick was coming out of the defendant's north slip into Calumet Harbor and covering an area of six thousand feet by fifty feet, but that the discharge was unintentional. In that court an expert witness testified that the slick, if continuously fed, would reach the intake of the south side water filtration plant of the city in a few days. If this occurred special filtration would be necessitated. The State Supreme Court in affirming the circuit court held that the statute, giving the district the power to prevent pollution of the sources of the city's water supply, gave authority for the district to get an injunction to prevent industrial pollution and that the statute was compatible with the federal statute relating to control of water pollution. REGIONAL WATER QUALITY STANDARDS,
Delaware River Basin Commission, Trenton, N. J. Water Quality Branch.
Ralph Porges.
ASCE Proc, J Sant Eng Div, Vol 95, No SA3, Pap No 6596, pp 423-437, June 1969. 15 p, 7 fig, 10 ref.

Descriptors: *Standards, *Water quality, *Water quality act, *Delaware River, Streams, Estuaries, Water pollution sources, Water pollution control, Dissolved oxygen, Streamflow, Regulation, Water management (Applied), Waste Disposal, Water treatment.
Identifiers: Delaware River Basin.

The Delaware River Basin encompasses many clean streams and a major pollution problem in the 85 mile long Delaware estuary. Water quality management concepts applied in the development of regional water quality standards included protection of clean streams, abatement of polluted waters, a minimum required degree of wastewater treatment, and the equitable apportionment of stream assimilative capacity. The Delaware River Basin Commission adopted water quality standards and regulations setting forth water uses to be protected, water quality criteria necessary to protect water uses, effluent quality requirements, and allocations of stream assimilative capacity. ASCE Proc, J Sanit Eng Div, Vol 95, No SA3, Pap No 6620, pp 545-561, June 1969. 17 p, 3 fig, 3 tab, 25 ref.

Descriptors: *Radioactive waste disposal, *Regulation, *Standards, *Water pollution sources, *Public health, Legislation, Environmental engineering, Radioactivity effects, Safety, Social aspects, Urbanization.
Identifiers: Reactor site selection, Public health considerations.

Factors of specific concern in the design and operating characteristics of nuclear plants to Federal, State, and local health agencies include physical and demographic site characteristics, potential air, water, land, and food contamination, land use, zoning, and exposure pathways. These factors must be considered to assure that the operation of one or more reactors at the selected site will not adversely affect the population and environment surrounding the plant. Research programs at operating power reactors are being coordinated to determine the methodology and analytical techniques required for an optimum surveillance program. The nuclear facility operator in cooperation with the State health agency should have a planned and rehearsed emergency plan which can be placed into effect to minimize adverse consequences in the event of an accident. SEWERAGE AUTHORITIES LAW.

NJSA secs 40:14A-2, 40:14A-6, 40:14A-20, 40:14A-28 (1967).

Descriptors: *New Jersey, *Pollution abatement, *Water pollution, *Treatment facilities, Legislation, Water pollution control, Public health, Water purification, Local governments, Waste treatment, Impoundments, Administrative agencies, Condemnation, Eminent domain, Public utilities.
Identifiers: Service charges.

The purpose of this act is to relieve water pollution by all reasonable means in waters in or bordering the state. Counties and municipalities are authorized to construct and operate sewage treatment facilities and, if necessary, works for the impounding, transportation and release of water for the replenishment of waters diverted into a sewage facility. The sewage authorities are given the power of condemnation. (The discharge by municipalities, counties or persons of sewage which may cause pollution is prohibited.) The discharge of any matter which may be harmful to the sewage system or its efficient operation is prohibited. (Childs-Fla)

STATE OF NEW HAMPSHIRE V ATOMIC ENERGY COMM'N (EVIDENCE OF POSSIBLE THERMAL POLLUTION NOT WITHIN JURISDICTION OF AEC).

406 F 2d 170-176 (1st Cir 1969).

Descriptors: *Federal jurisdiction, *Thermal pollution, *Nuclear reactors, *Administrative agencies, Judicial decisions, Permits, Administrative decisions, Nuclear wastes, Water pollution sources, Electric power plants, Electric power industry, Water temperature, Heated water, Temperature control, Environmental engineering, Water pollution effects, Oxygen sag, Fishkill, Cooling towers.
Identifiers: *Atomic Energy Commission.

Plaintiff sought review of an order of the Atomic Energy Commission of defendant's order which granted defendant a permit for the construction of a nuclear power reactor by several privately owned utility companies. New Hampshire argued that the operation of the reactor without a cooling tower facility would harm the natural resources of the Connecticut River by causing thermal pollution. The Atomic Energy Commission claimed that such evidence related to matters beyond its jurisdiction and granted the permit without considering the plaintiff's demands. The Commission held that neither the Water Quality Act of 1965 nor Executive Order 11288 were applicable to reactors which the Commission did not own or operate. This court affirmed the Commission's order. No licensing by the Commission acts to relieve the licensee from complying with federal or state water pollution control regulations. Though the Atomic Energy Act refers repeatedly to the 'health and safety of the public,' it does not define these terms. This lack of definition and the legislative history of the act indicated that the terms health and safety had reference to radioactive hazards, not thermal pollution. (Blunt-Fla)

POLLUTION, POISONING, ETC., OF STREAMS; DYNAMITING.

SC Code Ann secs 28-671 through 28-677, (1962).

Descriptors: *South Carolina, *Explosives, *Pollutants, *Poisons, Water pollution control, Water pollution sources, Fish, Fishkill, Fish toxins, Fish conservation, Shellfish, Legislation, Legal aspects, Fishing, Streams, Lakes, Rivers, Boats, Inland waterways, Public benefits, Electrical shocking gear.
Identifiers: Dynamiting.

It shall be unlawful for any person to cause poison or any other deleterious matter to enter any fresh or salt water of the state frequented by game fish, in a quantity sufficient to kill or stupefy any such fish of shellfish. The captain of any ship shall be responsible for any discharge of such substances from his vessel. Violators will be subject to fine and/or imprisonment. It is unlawful to poison the waters of the state in any manner for the purpose of taking fish. If any person casts impurities, poisonous to fish, into the waters of this state he shall be subject to fine or imprisonment. It shall be unlawful for any person to use explosives to take fish or to aid anyone else in doing the same or to possess such explosives on any vessel usually used for fresh-water fishing. Violators shall be guilty of a misdemeanor. If any person is found picking up fish within 2 hours after an explosion, it shall be deemed prima facie evidence of a violation of the above. Any person convicted of using explosives shall be prohibited from hunting or fishing within the state for 5 years. Anyone failing to report dynamiting used to unlawfully take fish within 2 weeks thereafter shall be guilty of a misdemeanor. Informers shall not be subject to prosecution for slander or malicious prosecution or subject to civil action for damages to the person so accused of using explosives. (Carruthers-Fla)

MISCELLANEOUS PROVISIONS (UNLAWFUL DISCHARGE OF OIL IN CHARLESTON HARBOR).

SC Code Ann secs 54-451 thru 54-458 (1962).

Descriptors: *South Carolina, *Harbors, *Oily water, *Docks, Ships, Pollution abatement, Pollutants, Legislation, Regulation, State governments, Damages, Rates, Salaries, Ships, Boats, Navigation, Transportation, Navigable waters.
Identifiers: Penalties, Liens, Wharfingers.

Charleston is declared to be the State port of South Carolina. To discharge oil from any vessel while within a harbor of this state is unlawful. Violation of this provision is punishable by fine not exceeding $500 which shall become a lien upon such vessel. It shall be unlawful to discharge oil any place within this state from which it shall drain into a harbor in any county containing a city with more than 60,000 population. Violation is punishable by fine not exceeding $500 and/or imprisonment not exceeding 6 months. If any person is injured through the mismanagement or negligence of the person in charge of a steamboat, the person in charge shall be punished by fine and/or imprisonment. Beaufort County shall build wharves at Buchingham Ferry and Jenkins Island to permit the docking of steamboats. Wharfingers shall be appointed at such wharves. Their salaries shall be paid from funds collected from boats docking at such wharves. (Kahle-Fla)

CRUSHED LIMESTONE BARRIERS: A BASIC FEASIBILITY STUDY IN THE NEUTRALIZATION OF ACID STREAMS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
R. Rupert Kountz, Robert E. Jarrett, and Alan F. Yen.
Institute for Research on Land and Water Resources, Research Project Partial Technical Completion Report, University Park, Pa., June 1969, 3 p, 1 ref. OWRR A-002-PA.

Descriptors: *Limestones, *Barriers, *Neutralization, *Acidic water, Mine drainage, Chemical reaction, Flow rates, Hydraulic models, Backwater, Coal mine wastes.

This project revealed that crushed limestone barriers can be used in streams contaminated with acid mine drainage to reduce the acidity in the water. Studies were limited to acidity concentrations less than 1,000 mg/1. Ferrous ion does not interfere with the neutralization process. However, ferric ion does interfere with it and will eventually render the limestone impotent because of a surface coating of iron oxide. Hydraulic model studies of barriers provided data on backwater depth, flow surfaces, flow rates, barrier lengths, and stone sizes. These studies indicated a barrier installation could have any reasonable number of units and be of such stone size as to be compatible with the site topography. The Commonwealth of Pennsylvania is constructing a prototype barrier installation based on the data developed in this project. (Pollard-Penn State Univ)
W69-08376

BIOLOGICAL OXIDATION RATES IN MINE ACID WATER REGIMES,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
R. Rupert Kountz, Lee Rosenberger, and W. A. Eberhardt.
Institute for Research on Land and Water Resources, Research Project Technical Completion Report, University Park, Pa., June 1969, 28 p, 25 ref, 4 tab, 7 fig, 1 append. OWRR A-001-PA.

Descriptors: *Biological treatment, *Mine wastes, *Self-purification, *Acid streams, Water purification, Iron, Organic wastes, Aerobic conditions.
Identifiers: *Velocity constants, Streeter-Phelps.

The velocity rate constants for biological oxidation were evaluated by employing synthetic sewage and laboratory simulated acid mine water regimes. Lowering of pH decreases the value of the rate constants until a maximum reduction of 65 percent is obtained at pH value of 4.0. Increasing concentrations of ferric ion cause a further, but small decrease in the rate constant. It was demonstrated that biological oxidation does occur in streams contaminated with acid mine drainage; consequently, the permissable discharge loadings can be calculated (by employing the reduced rate constants) either by manual computation, or the stream stretch can be developed with an analog computer programming. (Pollard-Penn State Univ)
W69-08379

WATER USE AND RELATED COSTS WITH COOLING TOWERS,
Illinois State Water Survey, Urbana, Ill.
Brian Berg, Russell W. Lane, and Thurston E. Larson.
Journal of the American Water Works Association, Vol 56, No 3, pp 311-328, March 1964. 18 p, 9 fig, 5 tab, 10 ref.

Descriptors: *Cooling towers, *Water cooling, Economics, Water treatment.

LIBRARY U OF I, URBANA-CHAMPAIGN

Identifiers: Once-through-cooling, Cooling tower concentration, Makenup water.

The authors made an economic evaluation of cooling towers for water reuse compared with once-through use. The location used in this report is northeastern Illinois. The report presents a method in which the approximate costs for specific cooling-tower applications may be estimated and compared with the costs of nonconservative practices. Chemical savings could be realized if mineral concentrations in the cycled cooling water were increased 5 to 10 times. In the refrigeration industry, evaporative, or air-cooled condensers are quite often economically competitive with the smaller cooling towers (10-100 tons). For maximum economy, optimum size match is desired between the equipment to be cooled and the heat dissipation equipment. Due to this, a competent engineer should be hired to study the specific cooling needs in detail. It is suggested that if the cost of both once-through and conservation equipment are within 30 percent of each other, there should be a thorough investigation. (Ross-Vanderbilt)

WATER POLLUTION CONTROL IN THE TEXTILE INDUSTRY,
American Textile Manufactures Inst., Charlotte, N. C.; and Burlington Industries, Inc., Greensboro, N. C.
R. W. Armstrong, and D. Byrd.
Textile Chemist and Colorist Vol 1, No 6, p 142/21-145/24, March 12, 1969. Based on a symposium, February 26-28, 1969, sponsored by A.A.T.C.C. and US Departments of Commerce and Interior.

Descriptors: Water pollution control, *Water pollution sources, Water pollution treatment, Biochemical oxygen demand.
Identifiers: *Textile wastes.

In the last ten years, the textile industry has made great strides in cleaning up waste waters. This massive campaign was initiated in order to comply with federal and state regulations concerning the pollution of our nations rivers and lakes. Although great progress has been made in this field, the textile industry is still subject to much criticism from small newspapers, radio and television. These charges, which are often false, have been leveled because of the textile industries poor history concerning the pollution of streams. In order to build a clean image, the industry must clean-up America's waterways and then must establish good public relations with the news media to inform the public of the work which is being done to solve the pollution problem. THE AVAILABILITY OF QUALITY WATER IS IMPORTANT IN PICKING A PLANT SITE,
Lockwood Greene Engineers, Inc., Spartanburg, S. C.
T. A. Fridy.
Textile Chemist and Colorist, Vol 1, No 7, p 185/40-187/44, March 26, 1969. Based on a symposium, February 26-28, 1969, sponsored by A.A.T.C.C. and US Departments of Commerce and Interior.

Descriptors: *Economics, *Treatment facilities, *Sites, Flow rates.

This article discusses the aspects which should be considered when picking a plant site. The geographic location influences the need for weather protection and design of mill. The topography has a bearing on the cost of operation and development. The surrounding industries and communities should also be investigated to insure that there is no major conflicts over waste disposal. The existing utilities and capacity to deliver necessary power, chemicals and water should be investigated. Finally, stream flow rates and other mandatory requirements should be studied. (Goodwin-NC State Univ)

WATER QUALITY MANAGEMENT IN VIRGINIA,
Virginia Water Control BOARD, Richmond, Va.
A. H. Paessler.
Textile Chemists and Colorist, Vol 1, No 7, p 181/35-184/38, March 26, 1969. Based on a symposium, February 26-28, 1969, sponsored by A.A.T.C.C. and US Departments of Commerce and Interior.

Descriptors: *Dissolved oxygen, *Standards, *Water quality, *Water temperature, *Water quality control, *Water management (Applied), Sampling, Nutrients, Analysis, Flow rates.

The Virginia State Water Control Board administrative set-up is described and compared with water quality management agencies in other states. In order for such an organization to function, it was necessary to establish standards for water quality. These were published in the water quality act of 1965 and in the so-called anti-degradation statement. The chief index to water quality is temperature with the dissolved oxygen content being the second most important standard. The effect of low flow rates is discussed. The three methods of water quality management programs - (1) stream sampling, (2) sample analyses and (3) data storage, processing and retrieval are discussed in detail. However, problems such as nutrient enrichment and land run-off or natural pollution remain unsolved. (Goodwin-NC State Univ)

Based on a symposium, February 26-28, 1969, sponsored by A.A.T.C.C. and US Departments of Commerce and Interior. Textile Chemist and Colorist, Vol 1, No 7, pp 173/25-176/28, March 16, 1969.

Descriptors: *Water quality, *Water Resources Planning Act, *Water shortage, *Water resources, Standards, Economics.

A growing population and expanding economy require that water quality control be maintained at a level making multiple reuse possible. Congress has established a Water Resources Council to determine National Water needs and plan development of the Nations' major river basins. Results of Bureau of the Census canvas on the withdrawal and use of water in textile manufacture for 1954, 1959 and 1964 are summarized. Increased concern about water quality by the industry is indicated. (Livengood-N C State Univ)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

APPLICATION OF COMPUTERIZED OPERATIONS RESEARCH TECHNIQUE FOR OPTIMUM ECONOMIC SIZING OF THE MIDDLE FORK EEL RIVER PROJECT,
California State Dept. of Water Resources. Advanced Techniques Section.
Gary S. Risch.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 268-279, 1968. 12 p, 2 fig, 5 tab, 4 ref.

Descriptors: *Operations research, *Systems analysis, Computer programs, Synthetic hydrology, Linear programming, Dynamic programming, Optimization, Economics, Cost-benefit analysis, Reservoir operation, Planning, Streamflow forecasting, Water supply, Water yield.
Identifiers: Eel River (Calif).

The difficulty of the economic analysis of hydrologic projects usually increases exponentially as the number of system components increases. Conventional methods of developing graphs, charts, and curves are being replaced, or at least supplemented, by new operations research techniques such as linear and dynamic programming. These techniques will aid the planner in analyzing hydrologic and economic problems and in providing an optimum economic solution with much less effort than expended using conventional methods. Planning for development of the Eel River, involving 3 potential reservoirs and a connecting tunnel has given us the opportunity to test these new techniques on a medium sized project. This paper illustrates how the computer model could be formulated for both linear and dynamic programming solutions to this sizing problem. Very little knowledge of the linear programming theory is necessary to make use of that technique; however an illustration of the dynamic programming theory is presented to clarify the dynamic programming solution methodology. A REVIEW OF SOME APPLICATIONS OF MATHEMATICAL PROGRAMMING TECHNIQUES IN WATER RESOURCES ENGINEERING,
Technion - Israel Inst. of Tech., Haifa. Lowderm Faculty of Agricultural Engineering.
Nathan Buras, and Theodore Herman.
Technion, Israel Inst Tech Progr Rep No 2, July 1968. 131 p, 21 fig, 95 ref.

Descriptors: *Systems analysis, *Optimization, *Water resources development, Water management (Applied), Computers, Computer programs, Dynamic programming, Linear programming, Estimating, Surveys, Management, Operations research, Queueing theory, Optimum development plans, Stochastic processes, Synthetic hydrology, Model studies.
Identifiers: *Water resources engineering, *Israel

The progress of Technion, Israel in using systems analysis in solving water resources development and management problems is discussed. A wide variety of analytical methods were applied in

sign of water resource systems. Most of them, wever, pointed out the necessity of setting up chastic sequential models, as the best approxi-ations to the real situation. Dynamic pro-amming seems to fill this need, with its variations d adaptations. However, the effectiveness of namic programming is limited by the computa-nal difficulties. The conjunctive development d utilization of surface storage and groundwater uifers, especially in semi-arid regions, were suc-sfully analyzed through dynamic programming. ginning with rather simple models, the analysis ogressed to include stochastic inflows serially rrelated, and more specific aquifer-oriented oblems. One such model touched upon the im-rtant problem of optimal exploitation of a astal aquifer, where the salt water-fresh water in-face has an important role. Another model alyzed in great detail the behaviour of an aquifer, ich has to satisfy certain demands for water and ich is connected to the surface storage system through its recharge facilities. Markov ain theory was applied also the derivation of erating rules for multistructure systems, as well to the analysis of problems connected with pollu-n transport in streams. Linearized models of ter resource systems have been used also in the sign and operation of surface reservoirs. (Knapp-SGS)

e role of systems analysis in the design of optimal ter resource systems was discussed. Previously planning process had been largely in the main of engineering and hydrology. Economics had been treated as an incidental matter to be considered at the end of a project in an effort to justify it. The methodology of systems analysis had been introduced in the past decade and economics had become an integral part, along with engineering and hydrology, of the planning of water resource development. The design of water resource system, be it single or multiple, was subject to alternative plans. The use of benefit-cost analysis, optimization and simulation techniques and of synthetic hydrology for optimal water resource systems planning was considered. (Thiuri-Cornell)

AN APPLICATION OF NON-LINEAR PROGRAMMING TO THE PLANNING OF MUNICIPAL WATER SUPPLY SYSTEMS: SOME RESULTS,
Harvard Univ., Cambridge, Mass. Harvard Water Program.
Clifford S. Russell.
Proc, Nat Symp Anal Water Resource Syst, pp 309-314, Denver, July 1968. 5 p, 1 tab, 1 fig, 6 ref.

Descriptors: *Optimization, *Planning, *Municipal water, *Water supply, *Model studies, Timing, Size, Systems analysis, Mathematical models, Interest rate, Economies of scale.
Identifiers: Rules of thumb.

A non-linear programming model was developed and used to analyze water systems for the purpose of generating 'optimal rules of thumb' for the use in the practical planning of Municipal water supply. The analysis included the time path of water system development showing periods of optimality, adequacy and inadequacy, the framework of the model, implications for practical planning, timing and optimal size. It appeared that the optimal size was relatively constant over time when the interest rate was low and/or economies of scale were important, but that the size increased significantly with time when the interest rate was large and economies of scale unimportant. The results obtained pointed to a promising method of harnessing the technique of mathematical programming for the benefit of practical planners. Calculations for the required ranges of key parameters could in principle be done at a central location, and the results made available in the form of size and timing handbook rules. A sample of the handbook tables for optimal rules of thumb was presented. (Thiuri-Cornell)

G. K. Young.
Proc, Nat Symp Anal Water Resource Syst, pp 289-297, Denver, July 1968. 9 p, 1 tab, 3 fig, 10 ref.

Descriptors: *Surface water, *Planning, *Pollution abatement, *Dynamic programming, *Monte Carlo Method, *Risks, Computer programs, Control systems, Economics, Water resources, Hydrologic systems, Reservoir operation, River systems, Decision making.
Identifiers: Kanawha River.

Two studies on surface water were discussed. The first discussion provided case study information which compared relative importance of hydrologic uncertainties versus uncertainties in economic and engineering parameters. The second discussion involved computational aspects of the Monte Carlo Dynamic Program for solving reservoir operation problems. For the first study an analysis of pollution control systems on the Kanawha River was made. The Kanawha River study provided the background on the importance of the various phases of the problem. The use of the Monte Carlo Dynamic Programming technique aided in the selection of computational procedures which provided useful information for decision-making on the final commitment of time and money in any systems analysis study. It was concluded that hydrologic uncertainties are less important than other engineering and economic uncertainties. Waste loading and the other engineering and economic factors appeared to contribute greater uncertainty to planning decisions than hydrologic factors. (Thiuri-Cornell)

OPTIMUM OPERATIONS FOR PLANNING OF A COMPLEX WATER RESOURCES SYSTEM,
California Univ., Los Angeles. Water Resources Center.
W. A. Hall, R. W. Shepard, W. S. Butcher, A. M. Esogbue, and S. C. Parikh.
Water Resources Center, Univ. of Calif., Contrib, No 22, p 1-75, October 1967. 75 p, 8 fig, 11 charts, 14 ref.

Descriptors: *Mathematical models, *Dynamic programming, *Linear programming, *Financial feasibility, California, Optimization, Multiple purpose, Economics, Planning, Energy, Reservoirs, River basins, Water resources development.
Identifiers: Sacramento Basin.

A mathematical model for planning optimal operating policy for a deterministic 10-year critical period hydrology was developed and applied to a multipurpose water resource system involving a multireservoir and a multichannel development. The objective of the study was to maximize financial feasibility for planning purposes based on deliveries of firm energy, firm water, off-peak energy and off-season water. The combined water resource projects in the Sacramento Basin were studied. The analysis provided for the specification of the values of firm energy, firm water, dump energy and dump water produced in the critical period and specified for the volume of water to be pumped back for energy storage purposes. The whole system was decomposed into a 'master wholesaler'-'individual producer' relationship. Using dynamic and linear programming techniques the reservoir operators and the master maximize returns, the former for individual reservoir, the latter for the whole system. The analysis emphasized the advantages of system operation as compared to individual project operation. (Thiuri-Cornell)

LIBRARY U. OF L. URBANA-CHAMPAIGN

Identifiers: *The Colorado River Basin.

Linear programming and dynamic programming techniques were applied to the Colorado River Basin to achieve an optimal allocation of its water resources. Both tangible and intangible benefits were considered. It was assumed that the objective function was to maximize regional net benefits subject to the overall regional and individual-study-area constraints. In addition, individual areas sought to maximize their benefits subject to their area constraints. The mathematical programming .nodel developed, offered quantitative techniques for evaluating interdependencies that are of prime concern for regional analysis. It was concluded that the rigid 'requirements' concept ignored the fact that water-resource can be allocated efficiently under competitive economic conditions, and caused water supply systems to be expanded, often at high cost, in order to artificially keep the imputed water value equal to zero. A strong argument for allocating water resources efficiently under competitive economic conditions was provided. (Thiuri-Cornell)

A FIRST TRIAL IN OPTIMAL DESIGN AND OPERATIONS OF A WATER RESOURCE SYSTEM,
Massachusetts Inst. of Tech., Cambridge.
Bruce Blanchard.
Unpublished, Master's, Thesis, Civil Eng, August 1964. 100 p.

Descriptors: *Linear programming, *Optimization, *Design, *River basins, *Hydrologic data, Economics, Simulation analysis, Planning, Water resources, Constraints.
Identifiers: Sensitivity analysis.

A linear programming model was used as a first trial in optimal design of a river basin system. Sensitivity analysis techniques were applied to the linear programming model to examine the effect of errors in hydrologic and economic data and effects of changes in constraints. Results showed that a linear programming model could be used to reduce the number and the range of variables to be used in simulation studies of the basin, as well as, to point out areas of resource allocation in future planning studies. It was found that linear programming (with its considerable limitations) could be an effective technique for a first estimate of the optimal design and operation of a complex water resource system. STOCHASTIC DYNAMIC PROGRAMMING AND THE ASSESSMENT OF RISK,
Nevada Univ., Reno. Center for Water Resources Research.
William S. Butcher.
Proc, Nat Symp Anal Water Resource Syst, p 315-320, Denver, July 1968. 6 p, 7 ref.

Descriptors: *Stochastic processes, *Risks, *Dynamic programming, *Water resources, *Optimization, Mathematical models, Markov processes, Probability, Decision making, Reservoirs.

The objectives of water resources development, the role that risk plays in choosing these objectives, and the use of stochastic dynamic programming to assess risk in a certain limited number of water resource problems were discussed. Conventional analysis of water resources tended to ignore risk, yet in fact, risk was present and individuals had different assessment of its value placed on expectation of returns. By employing a mathematical model based on the Markov chain technique, the use of stochastic dynamic programming technique for assessing risk and uncertainty involved in making optimal policy decisions was presented. Stochastic dynamic programming is suggested as a means for coming to grips with some of the elements of risk that were not possible to assess by conventional reservoir operation studies. THE ROLE OF UNCERTAINTIES IN THE ECONOMIC EVALUATION OF WATER-RESOURCES PROJECTS,
Stanford Univ., Calif. Dept. of Civil Engineering.
Edward G. Altouney.
Stanford Univ Eng-Econ Proj Rep No EEP-7, Aug 1963. 115 p, 32 fig, 8 tab, 23 ref.

Descriptors: *Cost-benefit analysis, *Project planning, *Risks, *Water resources development, Economics, Management, Statistical methods, Forecasting, PLANNING, Systems analysis.
Identifiers: *Uncertainty analysis.

Estimates of benefits and cost of water resources development are contingent upon numerous assumptions for the future and are subject to uncertainty. Since a single-valued benefit-cost ratio is used as a criterion for determining the economic value of a project and for relative ranking of projects, a measure of the uncertainty of the benefit-cost ratio was found necessary to determine if the funds invested in water projects are truly as productive as claimed. The degree of uncertainty of preliminary cost and benefit estimates was studied to allow the uncertainty of the estimates to be included in the economic evaluation of projects. It was found that cost estimates are undervalued an average of 75% below actual costs, and median cost estimates are undervalued 30% below actual costs, after adjustment of the actual costs for construction price trends, changes in project planning, structural and engineering modifications and national emergency. The undervaluation of costs is even greater before the adjustments. Lognormal distribution functions were found applicable to the ratios of actual to estimated costs and their parameters were computed for the various classes of cost ratios. It was found that the average annual benefits are on the average overestimated. The overestimation was found to increase with the length of the project lifetime and to decrease with the discount rate. A SAMPLE CALCULATION AND Fortran program listing are included. (K-napp-USGS)

Descriptors: *Water Resources Planning Act *Water resources development, *River basin commissions, River basin development, Interbasi transfers, Federal government, State governments Local governments, Water quality, Water utiliza tion, Water policy, Administration, Legislation Estimating, Long-term planning, Planning Cooperation, Water allocation (Policy), Wate supply, Water pollution control.
Identifiers: Federal-state cooperation, Wate resources council.

The structure and objectives of the Wate Resources Planning Act are discussed. Title I o the act sets up a Water Resources Council whos functions are to make a national assessment o water conditions, to establish a national pattern o federal water policy, to create federal-state rive basin commissions under Title II and to make 50% grants to the states for comprehensive wate resources planning. Title II establishes federal-stat commissions in order to provide for a collaborativ system of water planning among federal, state an local governments. Such interaction is necessar since each government has separate responsibili ties. The local governments are concerned chiefl with industrial and municipal supply while state are concerned with health and pollution measure The federal government is involved in establishin comprehensive and long-range programs and i aiding with financing and providing technical per sonnel. The commissions are planning bodies wit legislative powers left in Congress and the variou state legislatures. (Kahle-Fla)

RESEARCH ON COMPREHENSIVE PLANNI OF WATER-RESOURCE SYSTEMS,
North Carolina Univ., Chapel Hill
Maynard M. Hufschmidt
Natural Resources Journal, Vol 5, No 2, p 223-2 Oct, 1965. 13 p, 36 ref

Descriptors: *Planning, Technology, Legal aspe Inter-agency cooperation, Alternative co Economic prediction, Input-output analy Systems analysis

ntifiers: *Research needs, Social science, nning regions, Benefit functions.

s paper discusses research needs in comprehen- water-resource planning. Research topics are sented under three headings corresponding to ee major steps of the planning process: (1) ablishing the objectives of design; (2) translating ectives into design criteria; and (3) designing system, through use of the design criteria, for ximum realization of the objectives. Classifying earch in this way emphasizes research problems olving the relationship between social science technology. Two research problems are in- ved in stating objectives. One is to determine ether the federal legislature can express objec- s in forms useful for field-level planners. The ond, involving situations where federal, state, local agencies all participate in planning, is to ify whose objectives are to govern. Translating ectives into criteria involves the following stions: roles of various agencies in deriving ndards and criteria; consideration of alternative t instead of benefits; and definition of ap- priate planning regions. Systems design requires earch on: techniques for regional economic pro- tions; derivation of benefit functions; deriving input-output relationships; preliminary screen- techniques for system design; systems analysis hniques; and the system design process as a ble. ONOMIC AND RELATED PROBLEMS IN NTEMPORARY WATER RESOURCES ANAGEMENT,
sources for the Future, Inc., Washington, D. C.
en V. Kneese.
tural Resources Journal, Vol 5, No 2, p 216-258, t 1965. 23 p.

Descriptors: *Administration, Economics, Water allocation (Policy), Water demand, Water costs, Water transfer, Waste disposal, Water quality, Flood control, Navigation, Optimum development plans, Risks, Cost-benefit analysis.
Identifiers: *Research needs, Recreation benefit estimation, Public investment.

The water resource economist-planner faces enormous problems and a lack of researched answers. The rapid urbanization and industrialization of American society; the growth of population and enormous expansion of the economy; and the rapidity of scientific and technological advances have created problems of strong conflicts between uses. Planners must evaluate water services whose market purchase at best generates indirect indications of their value. Projects are called upon not only to meet present and future demands for water but also to stimulate economic growth. Economic research and research on institutional capacities for these complexities is required. After summarizing past contributions of economic theory, the paper defines problems of: water transfer; recreation benefit estimation; waste disposal in water; integrated management of water quality and quantity; use of case studies; evaluation of present and future costs and benefits from public investments; and a method of handling risk and uncertainty. (Gossen-Chicago)

WINDFALL GAINS FROM TRANSFER OF WATER ALLOTMENTS WITHIN THE COLORADO-BIG THOMPSON PROJECT,
Economic Research Service, Washington, D.C.; and Colorado State Univ., Fort Collins.
Raymond L. Anderson.
Land Econ, Vol 43, No 3, p 265-273, Aug 1967. 9 p, 6 ref.

Descriptors: *Legal aspects, *Taxes, Federal Government, Rights.
Identifiers: *Colorado-Big Thompson project, *Windfall gain.

Windfall gains may result when individuals sell water rights that have been developed as a result of governmentally financed water projects. This paper studies the effect upon the use and transfer of the water resources in question if the laws were changed to enable recapture of the unearned increments by the Federal Government through taxation. The Colorado-Big Thompson project is used as a case study to show the basis of the argument for recapture of windfall gains; also, the efficiency gains from the transfer of rights to the available water supply is examined. In conclusion the author states that under the situation that exists within the Colorado-Big Thompson project transfers of water allotments should be allowed even though windfall gains may result. Some of the windfall gains will be recaptured by the government through capital gains tax; also, the community will benefit by the more economically efficient use of the resources. (Grossman-Rutgers)

REGIONAL ECONOMIC DEVELOPMENT AND WATER,
State Univ. of Iowa, Iowa City. Dept. of Economics.
Wilbur R. Maki.
Agricultural Law Center, College of Law, The University of Iowa, Monograph No 10, p 84-104, Sept 1968. 21 p, 2 fig, 5 tab, 17 ref.

Descriptors: *Water resources development, *Growth stages, Spatial distribution, *Regional analysis.
Identifiers: Infrastructure, Population density.

There are four policy issues relevant to water resource development: (1) identifying viable development planning regions; (2) establishing nodal points for stimulating regional growth; (3) achieving rural-urban balance; and (4) facilitating regional planning and community development. A region's water resources are related to its economic development. Economic areas of low population densities are contrasted with areas of high densities. Each area has its own particular problems. The four stages of regional growth are identified. Regions and subregions are delineated and export producing activities, spatial linkages, and regional organization are considered. A section on improving regional economic structures is included. It discusses industry mix and regional share and infrastructure and amenities. Also discussed is how to establish resource development priorities. (Grossman-Rutgers)

WATER RESOURCE DEVELOPMENT: PUBLIC AND PRIVATE INVESTMENT,
Michigan State Univ., East Lansing. Dept of Agricultural Economics; and Michigan State Univ., East Lansing. Dept. of Resources Development.
Allan A. Schmid.
Agricultural Law Center, College of Law, The University of Iowa, Monograph No 10, p 61-78, Sept 1968. 18 p, 29 ref.

Descriptors: *Investment, Economic efficiency, Interest rate, Return (Monetary).
Identifiers: *Nonmarginal economic analysis.

The article discusses some problems of nonmarginal economic analysis; thus, the focus is on investments which fundamentally change the kind of inputs available and involve major changes in output choice. Also discussed are the choice of interest rate, the surplus crop question, and choice of investment criteria. Furthermore, investment involving public funds is linked with other institutional controls affecting resource use. The distributive issue of efficiency versus other values is examined. The uniqueness of water and public investment is also examined. In conclusion, the author states that the real problem is determining the proper mix of investments and how the returns of one investment affects the returns of the other. (Grossman-Rutgers)

Descriptors: *Water law, *Economic justification, *Project planning, Water resources development.
Identifiers: *North Central Region, *North Central Research Project NC-57.

The focus of the monograph is on legal-economic regional research concerned with investigating problems regarding the use, allocation, and development of water resources. This article re-examines legal and economic regional water resources research in the North Central Region. First, the organizational structure for regional research is examined. Second, the history and accomplishments of the North Central Region Research Project NC-57 are discussed. Finally, present research efforts are evaluated, and suggestions for future research are made. The summary states that current activities could be conducted equally well without a regional project. Therefore, modification of the present method of conducting regional research is needed. Two selected bibliographies are included. (Grossman-Rutgers)

Identifiers: *North Central Region.

This monograph is a report of a seminar on water resources. The seminar had the following purposes: (1) To assess viable opportunities for regional research on water resources in the North Central States; (2) to furnish a basis for improvement of regional water research; and (3) to lay a foundation for a long term program of regional research on water. Specifically, the report covers regional research in water in the North Central Region, conceptual issues in the conduct of regional research on the economics of water, regional and national planning of agricultural research, water allocation, water resource development, regional economic development and water and data systems and information retrieval adaptable to water resources. A short discussion paper follows each article. (Grossman-Rutgers)

A PROPOSED PARTNERSHIP COMPACT FOR OUR NATION'S RIVER,
Alvin C. Watson.
Journal of Soil and Water Conservation, Vol 24, No 3, p 89-94, May-June 1969. 6 p, 5 ref.

Descriptors: *River basin development, *Interstate compacts, *Interstate commissions, *Water resources development, Water conservation, Flood protection, Water pollution control, Water utilization, State governments, Project purposes, Planning, Long range planning, Projects, Administrative agencies, Water management (Applied), Administration, Basins, Federal government, Programs.
Identifiers: *Potomac River Basin.

Several of the reasons for attempting to set up an interstate-federal compact agency for the Potomac are: (1) the multiplicity of jurisdictions involved in water problems with a splintering of responsibilities, both compounded by a lack of coordination; (2) the studies that have set forth action programs which were never instigated; and (3) the need for comprehensive planning for water resources management. Problems of water supply, flood control and pollution have been focused on because of the Potomac's proximity to Washington. Recommendations from the President and the Corps of Engineers led a meeting of governors to appoint an advisory committee to set up the framework for a basin wide agency. That committee's proposal for a state-federal compact is outlined in detail. The most important role of the commission is to mobilize existing water resource agencies to perform their maximum responsibilities. The proposed interstate-federal compact would provide a mechanism for continuous planning and management of the basin's water resources. (Douberly-Fla)

ECONOMIC EVALUATION OF RESERVOIR SYSTEM ACCOMPLISHMENTS,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
Leo R. Beard.
Proc, Nat Symp Anal Water Resource Syst, p 278-288, Denver, July 1968. 11 p, 2 tab, 4 fig.

Descriptors: *Economics, *Computer programs, *Systems analysis, *Hydrologic properties, *Optimization, *Water resources, Reservoirs, Planning, Design, Evaluation.

Procedures of a comprehensive computer program that performed an elaborate hydrologic analysis of a system of reservoirs and assigned economic values to the output were described. The objective of the study was to lay a foundation for obtaining objective functions that expressed the socio-economic effects of a system, to provide intermediate hydrologic and economic data and a method of basing the actual design and operation of a hydrologic system on theoretical optimization techniques. The computer program described performed an elaborate and detailed sequential analysis of almost any configuration of water resource projects. System characteristics and requirements could be specified in any desired degree or detail with minimum effort. Output included detailed data on the month to month operation, as well as hydrologic and economic summaries useful for rapid evaluation of system performance. (Thiur Cornell)

6D. Water Demand

FUTURE WATER SUPPLY O METROPOLITAN WASHINGTON REGIO REPORT NO 1, REQUIREMENTS AM SOURCES,
Metropolitan Washington Council of Govern ments, D. C.
Richard Hazen, Thomas M. Niles, Roy H. Ritter, and Abel Wolman.
Available from the Clearinghouse as PB 177 50 for $3.00 paper copies and 65 cents in microfich Metrop Wash Counc Governments, Board of Er Rep No 1, May 1967. 70 p, 7 fig, 14 tab.

Descriptors: *Water demand, *Water suppl *Water sources, *District of Columbia, *Urbaniz tion, Municipal water, Industrial water, Plannin Forecasting, Dams, Reservoirs, Streamflow, Riv basin development.
Identifiers: Washington DC Metropolitan are Potomac River.

The Washington Metropolitan Region is co sidered to encompass an area of 3,000 sq mi, i cluding the District of Columbia and adjacent citi and counties on both sides of the Potomac Rive The population of the region is expected to i crease from 2.6 million at present to 4.2 million b 1985 and 6.1 million by 2010. Average dry ye water demands will grow from 320 mgd supplied b major systems in 1966 to 670 mgd in 1985 and 1050 mgd by 2010. Of the total 110 to 150 m probably will be drawn from local sources oth than the Potomac River. Peak daily demands drought years will exceed average requirements approximately 80 per cent. The water needed fro

Potomac River or other non-local sources will rage 560 mgd and 900 mgd in 2010. Maximum ith requirements will be 728 mgd in 1985 and 0 mgd in 2010. Maximum day demands will be mgd in 1985 and 1620 mgd in 2010. The un-ilated Potomac River cannot be depended upon more than 374 mgd which barely supplied the er used in 1966, when some water restrictions e enforced. Increasing water demands and rring major drought conditions will require re curtailment of water use unless additional endable supply is provided as quickly as possi-(Knapp-USGS)

WATER CONSERVATION AND IRRIGATION CORPORATION.

Ala Code tit 12 secs 280-297 (1959).

Descriptors: *Alabama, *Water conservation, *Irrigation, Irrigation programs, Irrigation practices, Local governments, Legislation, Wells, Water supply, Flood control, Multiple-purpose projects, Municipal water, Industrial water, Eminent domain, Financial analysis, Cost allocation, Costs, Construction, Projects, Permits, Public benefits, Impoundments, Administrative agencies, Construction costs.
Identifiers: Water conservation and irrigation corporation.

The governing body of any county can declare the need for a water conservation and irrigation corporation. The contents and requisites of the certificate of incorporation, mode of its filing, and details regarding the board of directors and officers of the corporation are set forth. Such corporation shall have the power to: (1) provide a water supply by stream impoundment or wells, (2) develop and operate an irrigation project, (3) provide for flood control, (4) provide for multiple purpose developments, (5) enter into agreements and contracts with agencies of the federal government. Detailed procedures are outlined for the obtaining of permits for construction projects. The duties of the director of the department of conservation are included. Bonding and other financing matters necessary for the operation of such corporations are set forth. All counties, cities, towns and other political subdivisions are authorized to lease or convey real property to the corporation. Construction awards will be based on sealed bids and publicly advertized. Authorized agents and employees of the corporation shall have a right of entry on land, water and other premises to make surveys, drillings and examinations. Such corporations shall be exempt from all taxation in the state of Alabama. (Carruthers-Fla)

KEEP MAINE SCENIC; ALLAGASH RIVER AUTHORITY.

Me Rev Stat Ann tit 12, secs 631-633, 661-680 (Supp 1968-69).

Descriptors: *Maine, *Habitat improvement, *Shelterbelts, *Wildlife management, Watershed management, River basin commissions, Soil conservation, Wildlife conservation, Legislation, Scenery, Aesthetics, Conservation, Recreation, Scenic easements.
Identifiers: Wilderness areas.

The Maine State Park and Recreation Commission is to maintain a continuing keep Maine Scenic Program. A 12 member advisory committee to advise and consult with the State Park and Recreation Commission to carry out a general program for the elimination of litter along Maine's roadsides, beaches, and waterways is provided for. The Allagash River Authority and Wilderness Waterway is created to preserve and develop the state's waterways and wilderness recreational areas, and to prevent erosion, droughts, freshets and the filling up of waters. The Authority has the power to acquire land, water and power rights by purchase, rental or eminent domain. The Authority may also establish rules and regulations for the effective governance of the waterway and impose fines and imprisonment for their violation. The Act provides for a restricted zone of from 400-800 feet of the waterway to protect and develop its maximum wilderness character. The use of power driven watercraft along the waterway is forbidden and the building or expansion of structures within the restricted zone, except with Authority approval, is to be prevented. Existing sporting camps are to be bought by the Authority and leased back to the owners on terms and conditions imposed by the Authority. (Blunt-Fla)

WESTERN AND ATLANTIC RAILROAD V HASSLER (DAMAGES CAUSED BY INADEQUATE CULVERT).

92 Ga App 278, 88 SE 2d 559-565 (1955).

Descriptors: *Georgia, *Flood Damage, *Precipitation excess, *Rainfall intensity, Judicial decisions, Damages, Rainfall, Precipitation, Railroads, Culverts, Rainfall Disposition, Excessive precipitation, Runoff, Drainage, Surface runoff, Floods, Cloudbursts, Streams, Nonnavigable waters, Mills, Riparian land, Culverts, Drainage, Natural flow.
Identifiers: Act of God, Negligence.

Plaintiff owned a mill adjacent to a non-navigable creek. The creek flowed through a culvert under defendant's tracks approximately two thousand feet from the mill. The culvert was adequate in area to take care of the normal flow of the creek. The defendant raised its tracks two and one-half feet, and reinforced the culvert by adding several inches of new masonry, thereby reducing the flow of water through the culvert by about fifteen percent. The raising of the tracks prevented the overflow of the water in time of heavy rains. During such rains, plaintiff's mill and cotton gin were damaged because of flooding. The question presented was whether damage resulted from an act of God or through the fault of the railroad. The court held that this was a question for the jury. If the flood that did occur was so extraordinary and unprecedented that it could not have been foreseen and the damage could not have been prevented by prudential means, the railroad could not be held liable. (Heckerling-Fla)

THOMAS V LACOTTS (REASONABLE USE OF RIPARIAN WATERS).

257 SW 2d 936-941 (Ark 1953).

Descriptors: *Arkansas, *Riparian rights, *Alteration of flow, *Reasonable use, Pumping, Natural use, Legal aspects, Judicial decisions, Obstruction to flow, Pumps, Underground streams, Farms, Hunting, Surveys, Streams, Bayous, Water shortage, Damages, Dams, Land tenure, Riparian land, Boundaries (Property).
Identifiers: Evidence.

Plaintiff's property is separated from defendant's land by a meandering stream. Defendant dammed the stream at a point immediately before it entered the plaintiff's property. Plaintiff contended that the dam interferred with his riparian rights and lowered the underground water level causing plaintiff additional expenses in pumping. The court held that a riparian owner is entitled to the unimpaired natural

flow of a stream over his land, but this right is subject to reasonable uses by upper proprietors. Under the riparian doctrine, no proprietor has priority in the use of water in derogation or another's rights. The damages assessed by the Chancellor were affirmed. (Shevin-Fla)

UNITED STATES V STATE OF LOUISIANA (LOUISIANA BOUNDARY CASE).

89 S Ct 773-817, (1969).

Descriptors: *Federal-state water rights conflicts, *State governments, *Boundary disputes, *Boundaries (Surfaces), Legal aspects, Jurisdiction, Earth-water interfaces, Interfaces, Water law, Boundary processes, Political aspects, Federal government, Federal jurisdiction, Judicial decisions, Legislation, State jurisdiction, Water rights.

Plaintiff asks for a declaration that it is entitled to exclusive possession of and power over lands under the Gulf of Mexico which are more than three geographical miles from the coast. A previous case construing the Submerged Lands Act of 1953 held that the United States was entitled to submerged lands seaward of the three mile limit. Both parties ask for a supplementary decree designating actual boundaries. Such determination requires interpretation of the phrase 'the line marking the seaward limit of inland waters' from the prior case. That line must be drawn in accordance with the definitions of the Convention on the Territorial Sea and the Contiguous Zone. Consideration in construing such definitions is given to islands and their relationships to the mainland, their size, distance from mainland, depth and utility of intervening waters, shape of island, and relationship to configuration or curvature of the coast. The choice under the convention to use the straight base line method for determining inland waters against other nations rests with the federal government and not with the states. A special master was appointed to determine the actual boundaries by means consistent with this opinion. (Johnson-Fla)
W69-08134

CITY OF NEW YORK V BROOKLYN BOROUGH GAS CO (PUBLIC UTILITIES RIGHT TO NAVIGABLE STREAM).
105 NYS 2d 459-473 (SC 1951).

Descriptors: *New York, *Public utilities, *Ownership of beds, *Navigable waters, Streambeds, Gases, Bridge construction, Pipelines, Public rights, Easements, Proprietary power, Grants, Prescriptive rights, Access routes, Roads, Relative rights, Projects, Safety, Riparian rights.
Identifiers: *Obstruction to navigation, *Nuisance (Public), Highway commissions.

The city brought suit to enjoin a gas company from maintaining a bridge and certain gas pipelines which were attached to the bridge and laid in the bed of a navigable stream. Defendant asserted that plaintiff, as successor in interest to the town, did not get absolute ownership of the creek bed since the town's highway commissioners had granted to defendant the right to do all things necessary to supply gas to the town. This impliedly gave defendant the right to use the creek bed as gas-pipe access route. Moreover, defendant alleged that the bridge was constructed pursuant to recommendations by a department of plaintiff-city. The court declared that this authorization was made on the condition that the federal government consent because the creek was a navigable stream. Any bridge construction without such permission did not give defendant the right to continue to use the bridge. The court ruled that since defendant failed to show the highway commissioners' power to grant the right to use the creek bed, such right could not be created by implication, especially where an obstruction of a navigable waterway would be caused thereby. The court concluded that defendant must remove the pipes and bridges at its own expense because defendant's right to exercise its franchise was subject to regulation when public safety required. (Reed-Fla)

MINNESOTA-WISCONSIN BOUNDARY COMPACT (PURPOSE AND INTENT).

Minn Stat Ann sec 1.31 (1967), as amended, (Supp 1968).

Descriptors: *Minnesota, *Interstate compacts, *Interstate commissions, Federal government, Legislation, Soil conservation, Soil erosion, Agriculture, Dams, Navigation, Water pollution, Recreation, Fish, Wildlife conservation, Water resources development, Water policy, Planning.

Minnesota agrees: to cooperate with other states party to this compact in establishing a boundary area commission; to consider the commission's recommendations with respect to regional planning for boundary areas and; to consider measures for controlling air and water pollution, programs for erosion control; diversion of waters from and into the rivers, and restrictions of land use to preserve recreation in river basins. The commission shall consist of five commissioners from each state with the powers and duties to make recommendations and correlate studies of the federal government and other agencies. No recommendation, plan or finding of the commission shall have the force of law or be binding upon any state agency. Studies may be made for determining the most beneficial plans for: regional development, navigation, dams, agriculture, fish and wildlife, recreation, commerce, pollution, other beneficial purposes. The commission is to be financed by donations and state appropriations. Each state reserves the right to withdraw from the compact at any time. (Kahle-Fla)

In a lower court lessee recovered a $50,000 judg
ment for damages against the city of Cleveland, t
condemnor. The basis of the suit was interferen
by the city with leased realty along the shoreline
Lake Erie by constructing a freeway on part
plaintiff-lessee's leasehold adjacent to the La
Erie shoreline. On appeal by the condemnor
questions of law, the Ohio Court of Appe
reversed and remanded. In the lower court, co
demnor was not allowed to introduce evidence th
the lease purported to cover land formed by filli
in the waters of Lake Erie beyond the natu
shoreline. The upper court held that this evident
ry exclusion constituted prejudicial error since,
condemnor's allegation were true, the title to t
shoreline over which this dispute arose wou
repose in the state of Ohio as trustee for the peo
and any lease executed pertaining to such la
would be void ab initio. The littoral rights of pla
tiff under such circumstances would be subject
regulation and control by the state and fede
governments. (Carruthers-Fla)

POLICE POWER AND DUTIES OF THE COMMISSIONER OF CONSERVATION.
Minn Stat Ann secs 97.50, 97.501, 97.55 to 97.57 (1957).

Descriptors: *Minnesota, *Conservation, *Regulation, *Wildlife, Water law, Wildlife conservation, Permits, Dams, State governments, Administrative agencies, Water pollution, Drainage, Jurisdiction, Legal aspects, Legislation, Beavers, Fishing, Hunting, Public lands.
Identifiers: *Police power, Penal statutes.

The Department of Conservation shall not stock any waters to which the public is denied free access. The Commissioner of Conservation shall grant to anyone taking rough fish under permit the right to sell such fish to any person. The commissioner may sell rough fish taken by fishermen under contract with the state. Moneys received from licenses, fines, sale of contraband, and reimbursements to the department shall be credited to a game and fish fund to be used for related purposes. The commissioner and his agents are empowered to serve all warrants for violations relating to wild animals, use and protection of water, conservation, dams and water pollution. They may arrest persons violating conservation laws. They may search and inspect certain premises and items for contraband and may confiscate game illegally taken and items used in the taking. The commissioner may enter into reciprocal agreements with the United States and other states for interjurisdictional appointment of game wardens. The department may remove any beaver dam interfering with proper drainage. (Helwig-Fla)

MINERAL LANDS AND LEASES.

Minn Stat Ann secs 93.01, 93.05 to 93.13, 93.34 to 93.355.

Descriptors: *Minnesota, *Mining, *Mineral industry, *Permits, Leases, Mining engineering, State governments, Mineralogy, Navigable waters, Lakes, Beds, Exploration, Exploitation, Drainage, Condemnation, Easements, Right-of-way, Ownership of beds, Streambeds, Water law, Riparian rights, Legislation, Legal aspects, Hydroelectric power, Contracts, Royalties.

The state reserves for its own use all valuable minerals and all water powers in land belonging to it. The holder of any mineral permit or lease in land may enter thereon and prospect. Before entry on the land any permit holder shall pay the land owner security for any damages. Upon request of any permit holder, the attorney general may initiate proceedings to condemn land in connection with any prospecting. All minerals under navigable lakes belong to the state. The Department of Conservation shall adopt regulations for the issuance of permits to mine beneath public waters. The holder of a mineral lease shall have the right to mine within the area covered by the lease. Anyone failing to comply with the terms of a lease shall forfeit such lease. Certain lakes may be drained and the iron ore removed from the bed. No one shall mine or drain a public lake without authority. The Commissioner of Conservation may sell mining permits for the beds of public waters. The holder of a permit may obtain a mineral lease and pay a royalty thereon to the state. (Helwig-Fla)

The Florida Supreme Court quashed consolidated cases of the Florida Second District Court of Appeal which construed the phrase 'net, traps or fishing devices' in Fla Stat sec 372.31 as excluding boats and motors used directly and on the water in poaching operations. The court held that the district court decisions were in direct conflict with the Florida Supreme Court case of Bruce v Malloy, 150 Fla 157, 7 So 2d 123 (1942) which construed an earlier version of Fla stat sec 372.31 as allowing forfeiture and disposal of boats and motors, and accordingly quashed and remanded the consolidated decisions of the district court. Justice Boyd dissented a length contending that Bruce v Malloy did not rule on the question of whether boats and motors were included in the forfeiture provisions of the statute and that the legislative history regarding revisions of the statute revealed an intent to exclude boats and motors from its coverage. PATUXENT RIVER WATERSHED.

MD Ann Code art 66C secs 411A thru 411U (1957).

Descriptors: *Maryland, *Watersheds (Basins), *Flood protection, *Watershed management, Conservation, Local governments, Legislation, Planning, Regulation, Land management, Costs, Taxes, Public benefits, Docks, Recreation, Roads, Beaches, Forests, Forest management, Parks, Erosion, Leases.
Identifiers: *Patuxent River, Misdemeanors, State agencies.

Counties in which a portion of the Patuxent River watershed is located, in cooperation with each other and the Department of Forests and Parks, are authorized to acquire land and adopt a watershed plan for the purpose of instituting a program of conservation and flood prevention. The plan shall include the proposed location and uses for such lands. After public hearing, the plan may be adopted by a majority vote of the county commissioners. The commissioners may make regulations for the use of the land, violations of which are deemed misdemeanors. The lands may be leased by the counties to private persons for periods not exceeding 20 years and for uses not inconsistent with the plan. Funds for acquisition of land may be obtained by donation, appropriation by the state or federal government, or by special taxes imposed by the county in conjunction with 50% matching funds from the Department of Forests and Parks. (Kahle-Fla)

PATUXENT RIVER WATERSHED.

MD Ann Code Art 66C secs 411A through 411 K (1957).

Descriptors: *Maryland, *Watershed management, *Local governments, Flood protection, Erosion, Legislation, Planning, Watersheds (Basins), Lland management, Public benefits, Docks, Roads, Beaches, Recreation, Cost, Leases, Conservation.
Identifiers: Patuxent River.

Howard, Montgomery, Prince George's, Anne Arundel, Calvert, Charles and St. Mary's counties, acting jointly and with the Department of Forests and Parks are authorized to define the Patuxent

LIBRARY OF THE CHAMPAIGN

River watershed in their counties for the purpose of protecting the watershed by a program of flood prevention and conservation. Each county may adopt and amend a watershed plan of recommendations for the protection of the watershed. Such plan shall include the location and proposed uses of lands to be acquired and the locations of roads, waterways, waterfronts, beaches, docks, parks, forest preserves, wildlife refuges and recreational areas. Before adopting or amending the plan the county must hold a public hearing, after 30 days notice, with the majority of the county commissioners voting in favor of the resolution. Each county may acquire and develop land (either within or without the county) necessary to carry out the plan. Land acquisition may be financed by donations or appropriations from the United States, the state of Maryland, or private persons. The counties may lease such lands or grant concessions to individuals for periods not exceeding 20 years and for purposes not inconsistent with the watershed plan. (Kahle-Fla)

PATUXENT RIVER WATERSHED.

MD Ann Code Art 66C secs 411 L through 411 U (1957).

Descriptors: *Maryland, *Watershed management, *Flood protection, *Land management, Erosion, Conservation, Planning, Regulation, Legislation, Watersheds (Basins), Taxes, Costs, Forest management, Parks, Forests, Local governments, Administrative agencies, Regulation.
Identifiers: *State agencies, Misdemeanors.

The county commissioners may make rules and regulations for the use of land acquired under this subtitle. These rules and regulations shall be posted on the lands and published in local newspapers. Violations of the regulations are deemed misdemeanors punishable by fine and/or imprisonment. The Department of Forest and Parks shall include requests for funds to be used for acquisition of lands in its annual budget. Such funds are to be matched by the county acquiring the land. The Department shall cooperate with the counties in formulating a Patuxent River watershed plan, and in acquiring land. The counties are authorized to levy an annual special tax upon all property in the county, the proceeds of which shall be used for the acquisition of land under the watershed plan. (Kahle-Fla)

Descriptors: *South Carolina, *Fish conservation, *Fishing, *Fish migration, Fish management, Nets, Fish ladders, Fish passages, Reasonable use, Dams, Legislation, Legal aspects, Water law, Sport fishing, Fish harvest, Sport fish, Water utilization, Regulation, Zoning, Control, Sluices, Water rights, Water sports, Recreation, Fishing gear, Local governments.
Identifiers: Penalties (Criminal).

Nets, traps, and other devices may be used to catch nongame fish in muddy inland waters. Such devices shall not be used from Saturday evening to Wednesday morning to take such fish. Special fishing regulations are set forth applicable to the respective game zones into which the state is divided. Other regulations deal with specific bodies of water. Most of these deal with the regulation of the use of certain fishing devices. For example, it is unlawful to take fish in game zone no. 1 by use of seines, and sport fishing there with rod and reel is regulated. Where seines are allowed, special regulations govern mesh size, length, etc. Game fish caught in nets must be immediately returned to the water from whence they came. No permanent obstruction, save dams for manufacturing purposes, may be placed in any waters of the state so as to obstruct free migration of fish. Dams on navigable streams must provide a fishway or ladder so that migratory fish may ascend upstream. The governing body of each county must designate the fish sluices on rivers so as to promote fish migration. There are seasons established for taking nongame fish in certain game zones. (Johnson-Fla)

ETKIN V HYNEY (LEGAL CONSTRUCTION OF RESTRICTIVE COVENANT).

299 NYS2d 862-864 (1969).

Descriptors: *New York, *Reasonable use, *Recreation, Lake shores, Land use, Recreation facilities, Water law, Judicial decisions, Legal aspects, Leases, Swimming, Boating, Shores, Islands, Land tenure, Riparian rights.
Identifiers: Restrictive convenants, Injunctions, Picnicking.

Defendant conveyed to plaintiff lands along a lakeshore upon which plaintiff constructed a dwelling. Defendant retained title to adjacent properties including a small island. In her conveyance to plaintiff, defendant restricted the use of the property to private residential uses only. Later, defendant constructed, on property nearby, six summer cottages and began to construct a road to permit access of her tenants to the lake shore and the island. The tenants and defendant's family used the island for picnicking, swimming and boating. Plaintiff sought to enjoin construction of the road and such use of the island, contending that these activities violated the restrictive covenant. The trial term held for defendant and the appellate division of the Supreme Court affirmed holding that the acts alleged were not inconsistent with the 'private residential uses' stipulated in the deed. (Carruthers-Fla)

Identifiers: Santee-Cooper area.

Congress is given consent to make all rules deemed necessary by the Federal Government regarding birds, animals and fish on lands in South Carolina purchased by the United States under a certain congressional act of March 1, 1911. The South Carolina Wildlife Resources Department may enter into a cooperative agreement with the Federal Government for the protection of wildlife resources of the national forest lands within the state. The Director of the Division of Game may close all hunting and fishing within such lands for such period of time as he deems necessary. The director may also prescribe hunting and fishing seasons and fees for licenses therefore and other such rules. Any person violating the rules so promulgated shall be subject to fine or imprisonment. These provisions shall apply also to other properties of the Federal Government and any other properties acquired therefrom by this state. Hunting and fishing is not allowed on lands controlled by the State Commission of Forestry, except by written agreement therewith. Funds collected on the Santee-Cooper area shall be used solely for game and fish protection in that area. The state assents to the act of Congress providing aid for wildlife projects. (Carruthers-Fla)

CAPITAL CANDY CO INC V CITY OF MONTPELIER (FLOOD DAMAGE FROM DRAINAGE SYSTEM).

249 A2d 644-646 (Vt 1968).

Descriptors: *Vermont, *Flood damage, *Storm drains, *Cities, Damages, Drainage, Floods, Appropriation, Eminent domain, Judicial decisions, Legal aspects, Competing uses, Relative rights, Surface drainage, Drainage water, Storm drainage, Storm runoff, Sewers, Drainage effects, Drainage practices, Watersheds (Basins), Preferences (Water rights), Public benefits, Public rights, Condemnation.
Identifiers: *Trespass, Negligence, Contributory negligence.

The plaintiff corporation brought an action for flood damage to warehouse merchandise as a result of defendant city changing its storm sewer system on adjacent land. The court affirmed a judgment for the plaintiff holding there was sufficient evidence that the city had caused the damage. The flooding of private land in the operation of municipal storm sewage system constituted appropriation of the land. The city was liable for this unlawful invasion of property. The fact that the drainage may have related to a public function did not excuse the neglectful trespass. The plaintiff had a right to improve and use his leasehold as it saw fit in spite of the probability of overflow. Plaintiff must have foreseen the damage with certainty to constitute contributory negligence on his part. (Breeze-Fla)

BROWN V CITY OF JOLIET.

247 NE2d 47-52 (Ill App Ct 1969).

Descriptors: *Illinois, *Surface drainage, *Storm drains, *Cities, Planning, Judicial decision, Land use, Regulation, Drainage programs, Administrative agencies, Legal aspects, Project planning, Sewers, Surface runoff.
Identifiers: City of Joliet, Illinois, Subdivision plat, Planning commission.

Brown, a subdivision developer, sued to require the city of Joliet, Illinois to record her subdivision plat. Her plat had been down by the city planning commission and subsequently the city council because they felt she had failed to include adequate plan for surface runoff. The planning commission felt that development without adequate provision for storm drains would increase drainage problems in adjacent areas and would not drain her own development properly. Brown claimed that the requirement of more adequate provision for surface runoff was an illegal confiscation of her property. Judgment was entered for the city. The city had authority to make regulations for adequate water drainage before recording of a plat. There was a presumption of validity of these ordinances. There was sufficient evidence to show that Brown had not made adequate provision for surface drainage and that the city had acted properly under the ordinances. Brown was not deprived of property unconstitutionally as the problem required the city to be remedied was a product of her own specific and unique activity. The problem was not one of the general community which the city is trying to force her to remedy at her own expense. (Gadd-Fla)

ARKANSAS STATE HIGHWAY COMM V CARRUTHERS (DAMAGES IN EMINENT DOMAIN PROCEEDING).

439 SW2d 40-41 (Ark 1969).

Descriptors: *Arkansas, *Eminent domain, *Compensation, *Highway construction, Cost repayment, Condemnation value, Judicial decisions, Bridge construction, Land tenure, Damages, Leases, Access routes.
Identifiers: *Evidence.

The Arkansas State Highway Commission brought an eminent domain proceeding against appellees for the acquisition of lands needed for highway construction. On trial, the jury returned a $45,000 verdict in favor of appellees. At the trial the landowners testified to the estimated cost of constructing a bridge to provide access to a portion of their land after the taking. Appellee's witnesses also testified to damages to an airstrip which they were leasing. Appellant alleged error in the admission of this evidence. On appeal the Supreme Court of Arkansas held that the owner's testimony of a contractor's estimate was heresay and not expert testimony. The court also held when property is under lease at the time of the condemnation, the owner's damages are confined to the reversion--not the leasehold estate. (Harris-Fla)
W69-08184

ROCKEFELLER V HOGUE (REMOVAL OF GAME AND FISH COMMISSIONERS).

439 SW2d 805-813 (Ark 1969).

Descriptors: *Arkansas, *State governments, *Administrative agencies, *Adjudication procedure, Administration, Governments, Judicial decisions, Jurisdiction, Legal aspects, Decision making, Political aspects, Personnel management.
Identifiers: State constitutions, Injunctions.

The governor of the state sought to remove two members of the Game and Fish Commission. He appointed a panel to hear the charges and to present the record to him. The commissioners obtained an injunction in the Chancery Court enjoining the hearing and the governor appealed. The commissioners had been appointed pursuant to the state constitution which also provided for their removal from office by the governor after a hearing. The hearing was subject to review by the Chancery Court and appeal to the state Supreme Court. The court interpreted this provision of the constitution to mean a commissioner removed by the governor was entitled to a new trial on the merits without regard to any error in proceedings before the governor. The court held that the commissioners had a full and adequate remedy at law and the Chancery Court was without jurisdiction to issue the injunction. There are two concurring opinions. (Helwig-Fla)

STATE BOARD OF HEALTH, RAILROADS, WATER AND ICE SUPPLIES.

17 SC Code Ann 235 (1962).

Descriptors: *South Carolina, *Potable water, *Water quality, *Railroads, Ice, Coolants, Domestic water, Transportation, Public health, Human diseases, Water purification, Water storage, Water supply, Legislation, Interstate, Administrative agencies.
Identifiers: *US public health service, Certified water, Interstate quarantine.

Water provided for drinking or cooking in railway trains or stations must be certified by the United States public health service as meeting interstate quarantine regulations of the United States. Ice used to cool such water must be clear, natural ice made from distilled or certified water. If such ice contacts the water, it must first be washed and handled so as not to contaminate the water with infectious organisms. Ice not contacting the water need not meet these standards, and all newly constructed railroad cars shall be made so that cooling ice does not contact the water. When water and ice are put in the same compartment, the tank shall be cleaned each week it is in use, and drained and flushed at least once a month. Portable tubing used to fill drinking water containers shall have smooth metal nozzles protected from dirt and contamination. Such tubing shall be flushed prior to each filling. (Harris-Fla)

LIBRARY U. OF L. URBANA-CHAMPAIGN

tion procedure, Remedies, Judicial decisions, Obstruction to flow, Alteration of flow.

Plaintiffs brought an action for damages against the city and its engineer because their raising of the grade of a street in front of plaintiffs' property caused increased flowage on plaintiffs' land, flooded plaintiffs' basement, and hindered part of their land inaccessible from the street. A new trial was granted the city on grounds of excessiveness of the $3,500 verdict awarded plaintiffs. On appeal by plaintiffs, the trial court's action in granting the new trial was upheld. The appellate court could not weigh the evidence, but only determine whether there was evidence that reasonable supported the trial court's decision. (Kahle-Fla)

STATE V CORE BANKS CLUB PROPERTIES INC (CONDEMNATION OF LAND FOR USE AS NATIONAL PARK).
167 SE2d 385-392 (NC 1969).

Descriptors: *North Carolina, *Condemnation, *National parks, *Seashores, Land use, State governments, Administrative agencies, Federal government, Legislation, Judicial decisions, Adjudication procedure, Public benefits.

Plaintiff, state of North Carolina, acting through its Department of Administration, sought to condemn defendant's shoreline property in order to convey it to the United States for a national park. The court held that such condemnation would be for a proper public purpose, since some benefit would accrue to the state. A statute granting the Department of Administration the power of eminent domain, however, did not authorize that agency to decide public purpose or initiate state projects utilizing the power of eminent domain. The statute merely appointed the department as an acquisition agent for the state. Since no express legislation authorized the department to condemn seashore property in order to convey the same to the United States, the department was without power to condemn defendant's land. (Kahle-Fla)
W69-08189

CITY OF LOUISVILLE V LOUISVILLE SEED COMPANY (MUNICIPAL TORT LIABILITY FOR FLOOD DAMAGE).
433 SW2d 638-644 (Ky 1968).

Descriptors: *Kentucky, *Floods, *Flood damage, *Local governments, Remedies, Damages, Adjudication procedure, Judicial decisions, Floodgates, Flood control, Public benefits, Cities.
Identifiers: *Municipal tort liability.

Plaintiff was awarded damages for an injury allegedly caused by flood waters resulting from defendant city's failure to install flood gates in the municipal flood wall system. On appeal, the judgment was reversed. The court held that a city could not be held liable in tort for a risk which was inherently part of the function of government. The city was not legally required to engage in the maintenance of flood control facilities. A city can be held liable only where it deals with a party on an individual basis, rather than as a member of the general public. Flood control facilities were beneficial to the entire citizenry and plaintiff's damage could not be separated from damages occasioned by the general public. (Kahle-Fla)
W69-08190

BALDWIN V ANDERSON (TITLE TO LAND FORMED BY AVULSION OR ACCRETION).

40 Wis 2d 33, 161 NW2d 553-560 (1968).

Descriptors: *Wisconsin, *Accretion (Legal aspects), *Avulsion, Land forming, Land tenure, Land classification, Rivers, Boundaries (Property), Judicial decisions, Legal aspects, Water law, Watercourses (Legal), Boundary disputes, Riparian land, Riparian rights.
Identifiers: Doctrine of 'doubtful title'.

The sellers of a farm, one original boundary of which was a river, brought an action to collect on a note given by the buyers as earnest money for the proposed sale. The lower court dismissed the complaint and the sellers appealed. When the sale had been completed it was not known whether the river originally forming the southern boundary of the property had shifted its course through accretion or avulsion. Therefore, it was not known whether title to the newly formed land was in the owners of the farm or in a riparian owner of lands originally north of the river. The buyers, believing that there was reasonable doubt of merchantable title refused to close the transaction. The court, after defining avulsion and accretion and discussing their effects on land ownership, held that there was reasonable doubt whether title to the farm was merchantable and the purchasers were justified in refusing to close the transaction. (Carruthers-Fla)
W69-08191

SMITH V BOARD OF COUNTY ROAD COMMISSIONERS OF CHIPPEWA COUNTY (FLOOD DAMAGE CAUSED BY ROAD CONSTRUCTION AND ACT OF GOD).

381 Mich 363, 161 NW2d 561-569 (1968).

Descriptors: *Michigan, *Highway effects, *Floods, *Rain water, Basins, Rainfall, Alteration of flow, Obstruction to flow, Damages, Remedies, Ravines, Judicial decisions, Adjudication procedure, Roads, Local governments, Flood damage.
Identifiers: *Act of God.

Plaintiff, landowner, brought an action in trespass for flood damages allegedly caused by defendants, county road commissioners, changing of the road level near a basin. Plaintiff charged that the altered road level was a contributing and concurring cause of water breaking through and washing out a road on the opposite side of the basin and washing plaintiff's residence and inhabitants into a large ravine created by the water. The sole issue was whether plaintiff's damages were caused solely by an act of God, torrential rainfall, or whether defendants' act was a contributing cause which would render them liable. Upon judgment for defendant and appeal by plaintiff the appellate court upheld the trial court's decision that the issue was one solely for jury determination. The Supreme Court affirmed the appellate court's decision. The dissent felt that there could be no finding that defendants were not contributorily causative and would have reversed solely on the issue of damages. (Kahle-Fla)
W69-08192

POWERS OF THE GOVERNOR AND COUNCIL.

NH Rev Stat Ann secs 4:10 (1955), 4:40-A, 4:40-B, 4:40-C, 4:40-D (Supp 1967).

Descriptors: *New Hampshire, *Beds under water, *Ownership of beds, *Interstate rivers, Political aspects, Legislation, Administrative agencies, Administrative decisions, Water law, Water policy, Legal aspects, Ponds, Navigable waters, Streambeds, Sands, Gravels, Water management (Applied), Public rights, Diversion, Rivers, Financing, Water resources.
Identifiers: *Deeds.

The governor may institute suits in the name of the state when, in his judgment, they are necessary to prevent the injurious diversion of the water of rivers which naturally flow from other states into New Hampshire. After consultation with the fish and game commission and other state agencies as may be involved the governor and counsel upon just consideration may convey sand and gravel which is on the bed of any navigable water or great pond. A great pond is any public water of more than ten acres. Petition for such conveyance is considered by the water resources board and, upon approval by it, the governor has an appropriate deed prepared. The board's recommendation incl all appropriate specifications and conditions n sary to the protection of public and private ri Consideration paid for taking sand or grav credited by the state treasurer to the appropri for the water resources board. Identifiers: Ingress, Egress, Shells, Contempt of court, Injunction (Prohibitory).

The plaintiff's land was bounded on one side by the Gulf of Mexico and on the other side by Sarasota Bay. Defendant's land adjoined plaintiff's land and his only access was along the foreshore or over plaintiff's land. Plaintiffs sought an injunction to prevent the defendant from hauling shell across their land. The lower court granted the relief plaintiffs requested. The defendant violated the injunction and was adjudged in contempt. In his order the chancellor stated that the defendant had a statutory right of way over plaintiff's land for the purpose of home, argicultural and stock raising, but for no other purpose. All other purposes would be in violation of the injunction. On appeal the court said that the defendant had no right to violate the chancellor's order. The court held the chancellor to be correct in limiting the route for removal of shell to the foreshore, as the foreshore by its very nature was available to the public for access. The court held this condition must exist until a public road across plaintiff's property was opened. (Shevin-Fla)

THE MARITIME BOUNDARIES OF THE STATES.
Avrum M. Gross.
Mich L Rev, vol 64, No 3, pp 639-670, Jan 1966. 32 p, 132 Ref.

Descriptors: *Law of the sea, *Submerged Lands Act, *International waters, Boundaries (Property), Ownership of beds, State governments, Federal government, Low water mark, International law, Inland waterways, Legislation, Shores, Coasts, Political aspects, Commercial fishing, Seashores, Bays, Inlets (Waterways), Boundaries (Surfaces), Locating, Water law, Legal aspects, Conferences, Watercourses (Legal), Federal-state water rights conflicts.
Identifiers: *Marginal seas, *Historical waters, Maritime areas.

While it has long been recognized that the seaward boundaries of coastal states encompass certain adjoining maritime areas, confusion over their precise location has engendered dispute. The First Law of the Sea Conference, convened at Geneva in 1958, helped to reduce these differences by establishing international norms for boundary delineation. A need for such norms also existed on the federal level in the United States. In an attempt to reduce disputes between the federal and state governments, Congress passed the Submerged Lands Act which granted the states title to all lands under navigable waters within a set distance from their coast as measured from the low water mark or the seaward limit of the inland waters. But in the absence of the establishment of standards regarding the location and extent of 'inland waters', uncertainty still remained. Finally, the Supreme Court was called upon to interpret this act. They adopted the standards agreed upon at the Geneva Convention as a workable definition of 'inland waters.' While boundary delineation problems will continue to arise within the Federal area, the adoption by the court of objective standards supported by international consensus has helped create a framework for orderly division of maritime jurisdiction between state and federal authorities. (Gabrielson-Fla)
W69-08329

POWER TO CROSS ROADS, HIGHWAYS AND STREAMS; CROSSING CANALS OR NAVIGABLE WATERS.

Md Ann Code Art 23, secs 203, 206 (1966), as amended, (Supp 1968).

Descriptors: *Maryland, *Railroads, *Streams, Bridges, Canals, Administrative agencies, Administrative decisions, Navigable waters, Nonnavigable waters, Roads, Highways, Transportation, Road construction, Streambeds, Diversion, Diversion structures, Legislation, Regulation, Legal aspects, Eminent domain, Railroad relocation, Engineering structures, Piers, Bridge design.
Identifiers: Crossings, Free passage.

Any railroad, in the construction of its road, may cross any road, highway or stream and divert the stream provided it be non-navigable. It is lawful for any railroad corporation whose railroad crosses a road or highway to carry the same over its tracks by an overgrade crossing or under its tracks by an undergrade crossing. The road or highway can be diverted from its existing location and the railroad can use appropriate legal processes if necessary to appropriate buildings, gardens or yards concomitant to such diversion. The railroad shall promptly replace such road, highway or stream so as not to impair its former usefulness. Such railroad will be liable for any damages caused by stream diversion. Whenever the line of any railroad company crosses any navigable water, said company shall file with the Board of Public Works the plan of fixtures to be utilized in the crossing. The Board's approval shall be in writing. If the kboard disapproves the plan, recourse can be had by the railroad in the circuit court which can appoint a disinterested engineer to prescribe a plan and can then issue an order of confirmation. But no railroad company can construct any permanent bridge less than 12 feet above the top water line, nor shall any piers or abuttments be placed so as to interfere with free passage. EQUIPMENT AND OPERATION OF VESSELS.

SC Code Ann secs 70-295 thru 70-295.17 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Boats, *Safety, *Boating regulations, Regulation, Water skiing, Standards, Legislation, Recreation, Safety factors, State jurisdiction, Navigable waters, Permits, Accidents, Marinas.
Identifiers: Flotation standards, Negligent operation, Alcohol, Drugs, Penalties (Fines), Penalties (Imprisonment).

The provisions herein apply to any vessel operated on waters of this state. The administration of this chapter is vested in the Wildlife Resources Department which shall set up a Division of Boating and carry out a program of safety education and training for law enforcement officers. No vessel not already in the hands of a dealer, other than one constructed of wood, shall be sold after January 1, 1962, unless its serial number is imprinted on the transom and unless it meets flotation standards of the Division. Owners of boat liveries must keep records for 6 months of the names and address of persons hiring vessels, identification number of the boat, departure time and expected time of return. Boats or water skis shall not be operated negligently or while the operator is under the influence of alcohol or drugs. The owner of a vessel is liable for its negligent operation unless such vessel is used without his express or implied consent. An operator of a vessel involved in an accident must render aid, leave his name and address, and where damage exceeds $100 or death occurs, file a report with the Division. Fines and imprisonment are imposed for violation of these provisions which may be enforced by any peace officer of the state. (Kahle-Fla)

SOUTH CAROLINA WATER RESOURCES PLANNING AND COORDINATING COMMITTEE.

SC Code Ann secs 70-21 thru 70-25 (Supp 1968).

Descriptors: *South Carolina, *Water resources development, *Water quality control, *Water management (Applied), Water utilization, Industrial water, Municipal water, Administrative agencies, Research and development, Legislation, State governments, Hydroelectric power, Navigation, Flood control, Drainage, Watershed management, Wildlife management, Water supply.

The South Carolina Water Resources Committee with 18 members appointed by the Governor is created. The interests represented are agriculture, industry, municipalities and salt water interests. Eight other members shall be the heads of the Department of Agriculture, Pollution Control Authority, Wildlife Resources Commission, State Forestry Commission, Soil and Water Conservation Committee, State Development Board, Clemson University Water Resources Research Institute, and the State Highway Department. The committee is authorized to conduct studies for the purpose of making recommendations to the Governor and to the General Assembly regarding a comprehensive water resources policy for the state. The committee may review actions of state agencies and federal projects in regard to water resources with a view toward establishing a consistent water resources policy. The committee, in exercising its duties, shall consider the need for: adequate supplies of water for domestic, industrial, agricultural and municipal uses; water quality controls; navigation facilities; hydroelectric power; flood control; land stabilization; drainage; watershed management; and wildlife management. KOSTON V TOWN OF NEWBURGH (WATER DISTRICT ASSESSMENT).

299 NYS2d 1007-1009, 1969.

Descriptors: *New York, *Water districts, *Assessments, *Municipal water, Cities, Wells, Judicial decisions, Legal aspects, Water law, Land tenure, Public rights, Public benefits, Taxes.

Petitioner, a landowner having his own private well, was located in a certain water district. He was assessed for the water district benefits, as were all persons owning real property in the water district. Petitioner paid the assessment under protest contending that he derived no benefit from the water district since he had his own water supply. The court held that even though a property owner has made private arrangements to provide the service offered by a special improvement district, he may be assessed on a benefit basis for the service offered in the district. The test of whether land has been benefited is not whether any advantage on its owner has been received but whether its general value has been enhanced. Here since fire protection facilities were improved and property values enhanced, benefits had accrued and the assessment was proper. (Carruthers-Fla)

Identifiers: *Blasting, *Negligence, Strict liability.

A lower court found the Village of Herkimer, liable for flood damage caused to plaintiff as a result of the blasting of an ice jam which obstructed a local waterway. Strict liability was the basis for recovery. On appeal plaintiff's judgment was reversed. The court held that the blasting was done to secure the public safety and that before plaintiff could recover for damages caused by floodwater stemming from defendant's action, a case in negligence would have to be established. ERY V REEVES (EASEMENT FOR IR- TION CANAL).

o 2d 64-67 (La Ct App 1959).

Descriptors: *Louisiana, *Irrigation canals, *Canal construction, *Right-of-way, Easements, Irrigation, Judicial decisions, Boundary disputes, Water wells, Water rights, Water utilization, Alteration of flow, Relative rights, Land use.

This was a slander of title action to compel cancellation of a right-of-way granted by plaintiff landowner for canal purposes to defendant's predecessor. In consideration for the right-of-way defendant's predecessor was to construct a canal from which plaintiff had the right to draw water for irrigation. The deed provided for automatic termination of the right-of-way if not used for canal purposes for three consecutive years. Plaintiff contends the right-of-way terminated because in 1945 defendant's predecessor abandoned operation of the canal system insofar as plaintiff's land to the north was concerned and that defendant's use of the canal for his own private purposes was not such a use as to prevent termination. The court held that defendant's predecessor had the express right to convey the right-of-way to defendant and that there was no restriction that the canal be used to carry water from any specified source or be used only in conjunction with the entire canal system. Although plaintiff, having constructed an irrigation well, no longer used the canal for irrigation the deed reflected no intention that the right-of-way should cease when he no longer benefitted. Judgment was for defendant. (Kahle-Fla)

STATE V BENTLEY (WATER DAMAGE).
71 NW 2d 780-787 (Minn 1955).

Descriptors: *Minnesota, *Eminent domain, *Water control, *Projects, Project planning, Water policy, Project purposes, Competing uses, Project benefits, Public rights, Condemnation, Condemnation value, Judicial decisions, Legal aspects, Water distribution (Applied), Water law, Water resources, Compensation, Flow augmentation, Channel improvement, Damages.

Plaintiff landowners intervened in condemnation proceedings instituted pursuant to Minnesota statutes which authorized water control projects. Plaintiffs claimed that their lands had been damaged by an increased volume of water flowage created by the water control projects. Plaintiffs' petition was denied by the district court and an appeal was taken to the Minnesota Supreme Court. The water control projects involved here consisted of widening and deepening existing channels and constructing dams and dikes on certain lakes. The supreme court held that the water control projects did no more damage to plaintiffs' lands than would have occurred in the same manner in a state of nature and that plaintiffs' lands had not been taken, damaged or destroyed by the state of Minnesota so as to justify compensation in an eminent domain proceeding. (Carruthers-Fla)

BOROUGH OF WINDBER V SPADAFORA (CONSTRUCTION EXTENDING INTO NON-NAVIGABLE WATER).
356 Pa 130, 51 A2d 726-730 (1947).

Descriptors: *Pennsylvania, *Non-navigable waters, *Riparian rights, *Streamflow, Damages, Local government, Cities, Legislation, Alteration of flow, Obstruction to flow, Floods, Riparian waters, Downstream, Administrative agencies, Streambeds, Legal aspects, Permits, Relative rights, Repairing.
Identifiers: Injunctions (Mandatory), Injunctions (Prohibitory).

Defendant owned riparian land on a stream within plaintiff borough. She erected a building on her lot and projected the foundation wall into the stream without a permit, as required, from the Water and Power Resources Board. The structure had been partially washed away and defendant expressed her intent to repair it despite being refused a permit by the Board. Plaintiff alleged the structure narrowed the stream causing downstream flood damage and asked an injunction to restrain the rebuilding of the structure and to require the removal of the encroaching portion. The Board joined as an intervener. The court held that a riparian owner on a non-navigable stream may construct anything he pleases to the thread of the stream unless it injures the public. The borough could not complain except to the extent the public rights were affected. The injunction to require removal of the structure was denied because of the borough's failure to prove injury to the public and because of the borough's long delay in seeking the injunction. The injunction, prohibited defendant from repairing her wall until a permit was issued; however, the injunction was granted because of the statutory requirement to obtain a permit. (Helwig-Fla)
W69-08567

UNITED STATES V LOUISIANA (SUIT BY FEDERAL GOVERNMENT AGAINST STATE TO DETERMINE CONTROL OF AREA OUTSIDE 3 MILE BELT).

339 US 699-706 (1950).

Descriptors: *Louisiana, *Federal jurisdiction, *Ownership of beds, *Federal-state water rights conflicts, State jurisdiction, Low water mark, Shores, Oceans, Gulf of Mexico, Beds under water, Tidal waters, Federal government, Boundary disputes, Minerology, Legal aspects, Judicial decisions, Treaties, United States.
Identifiers: *Three mile belt, Injunction.

The federal government alleged that all lands, minerals, and other things lying seaward of the ordinary low water mark on the coast of Louisiana and outside the inland waters were in the full domain and power of the United States government. They sought a decree adjudging and declaring the rights of the federal government in this area as against Louisiana, enjoining all others against trespass. Louisiana alleged that the federal government had claim to only those beds of the Gulf of Mexico to the extent of powers existing under the constitution, laws and treaties of the United States, none of which would affect the area herein concerned. Basing their decision on United States v California, 332 US 19, which held that the three mile belt of the shore was in the domain of the United States rather than the separate states, the Supreme Court reasoned that it would follow a fortiori that the area claimed by Louisiana extending 24 miles seaward beyond the three mile limit was also within the domain of the United States rather than that of Louisiana. 6G. Ecologic Impact of Water Development

AN ECOLOGICAL AND RECREATIONAL USE SURVEY OF THE LUXAPALILA RIVER,
Mississippi State Univ., State College. Dept. of Wildlife Management.
Dale H. Arner, Warren G. Anding, William Lunceford, and Charles Summerour.
Completion Report, Mississippi State Water Resources Research Institute, June, 1969. 48 p. OWRR Project A-029-MISS.

Descriptors: *Ecology, *Recreation, Invertebrates.
Identifiers: Luxapalila River (Miss).

An ecological and recreational use survey was made of the Luxapalila River in Mississippi. This study was made before channelization work was started by the Army Corps of Engineers. A follow-up ecological study is planned after channelization work is completed. Four stations located along a 10.5 mile stretch of river were selected for making certain chemical and biological measurements. The study was started in July, 1968, and concluded in June, 1969. Results of this study revealed that the

LIBRARY U. OF J. WATER RESOURCES CENTER ARCHIVES

Luxapalila River is rich in species of fish with 37 different species recorded. Collections of invertebrates were made over a period of 12 months by sweep netting and with square foot bottom samplers. The largest standing crop of 1.93 lbs. per acre (oven dry weight) was collected in September, and the smallest standing crop, 0.01 lbs. per acre, was found in December. Water chemistry and both air and water temperatures were recorded. The information obtained was characteristic of that from similar streams. Water table levels were measured at selected distances adjacent to the river. A survey of recreational use of the river was made, and it revealed that fishing was the major use (59 percent), FOLLOWED BY SWIMMING (28 percent). Ninety-five percent of the recreational parties interviewed were residents of the area, and most (83 percent) of these parties traveled less than 16 miles round trip to visit the river. Inaccessibility to the river due to private land holdings is believed to be a major factor in the small recreational use made of this river.

Descriptors: *Hydrologic data, *Data processing, *Digital computers, Data storage and retrieval, Data collections, Data transmission, Instrumentation, Telemetry, Remote sensing, Research and development, Hydrology.
Identifiers: Data analysis.

The digital computer is now an indispensable tool in the processing of hydrologic data. Further, it has become an indispensable assistance in the analysis of collected data and information. The ultimate consequence of this assistance will be the direct interfacing of computers with the experiment. Immediate consequences of the presence of computers are the need to reduce to digital form great masses of accumulated records; the reconsideration of experimental designs; the development of improved instrumentation and data acquisition systems; and the adjustment in thinking to realize the potential of computer assistance. Identifiers: Cameroon Republic, *Lake Chad Basin, Unesco, Chad Republic, Federation of Nigeria, Niger Republic.

This paper reports on studies and projects important to the Unesco hydrological synthesis of information on the Lake Chad basin, and on activities of the Unesco team. A short history is presented of the development of international cooperation in this four nation basin; Chad Republic, Federation of Nigeria, Niger Republic, Cameroon Republic. A review of the important research activities and publications concerning cartography, geology, pedology and hydrology of each country shows them to have been abundant and often very complete. The coordinating program of Unesco has as objectives: (1) acting as intermediary between governmental and scientific institutions, (2) coordination of present and future activities, (3) correlation of existing reports and maps, and (4) arbitration of criteria of the synthesis for utilization in formulating an analogue model. Present programs reported on include phreatic water studies in Nigeria and stable and unstable isotope investigations. (Sherbrooke-Ariz)

AN APPLICATION OF MULTIVARIATE ANALYSIS TO SEDIMENT NETWORK DESIGN,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
James R. Wallis, and Henry W. Anderson.
Int Ass of Sci Hydrology, No 67 (1965): 357-378.

Descriptors: *Analytical methods, *Sediment yield, *Hydrologic data, Project planning, Sampling, Regression analysis, Environmental effects, California.
Identifiers: Principal components analysis, Network design.

Most stream sedimentation stations are selected to answer the simple question, 'What sedimentation problem would confront a structure installed at this site today.' A network of sedimentation stations resulting from repeated application of this criterion will almost certainly be unsatisfactory for answering problems in sedimentation research and may often be unsatisfactory for answering the simple needs for structural design and evaluation. Analysis of the existing northern California suspended sediment data suggests that for some stations the number of sediment samples taken could be greatly reduced without impairing the accuracy of predicted sediment yield, and that in addition samples need to be taken on other watersheds. Network design should be kept flexible so as to meet changing sediment discharges from watersheds. An 11-step procedure is given which could be used for designing a sediment network to yield the maximum of useful information. An equation relating sediment discharge to changing watershed variables of forest fires, unimproved roads, logging of forests and conversion of forests to grasslands was developed by regressing on principal components.

STREAMFLOW VOLUMES AND HYDROGRAPHS BY FLUORESCENT DYES,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
B. C. Goodell, J. P. C. Watt, and T. M. Zorich.
Int Un of Forestry Res Organizations, 14th IUFRO Congress, 1967, (v. 1, Sect. 11): 325-348.

Descriptors: *Stream gages, Gaging stations, Hydrographs, Hydrometry, Tracers, Instrumentation, Fluorescence, Flow rates, Flow measurement, Flow, Fluorometry.
Identifiers: Stream flow gaging.

Two new methods of streamflow gaging are under development. Each employs the principle of dilution of fluorescent dye Rodamine WT. In each, a concentrated dye solution is injected at a constant low rate into stream from a Mariotte vessel of refined design. In one, small, discrete samples of the dosed stream are accumulated in a storage vessel. Sampling is at a stream point where mixing is complete and accomplished by a simple siphon device operating at a constant time cycle. Fluorometric analysis of a sample from the storage vessel following a week's accumulation enables calculation of weekly average rate of streamflow with useful accuracy if discharge fluctuations during week are moderate. In the other method, a small continuous diversion from the dosed stream is brought into contact with a clock-driven strip of commercially available gelatin-coated film. Dye is sorbed by the gelatin proportionately to its concentration. Laboratory analysis of the film by a specially modified fluorometer yields a hydrograph of the stream. This method is not limited to moderately fluctuating streams. Both methods are particularly designed for use on mountain streams where access is difficult and many years of record unnecessary. Development is continuing.

MULTIVARIATE STATISTICAL METHODS IN HYDROLOGY-A COMPARISON USING DATA OF KNOWN FUNCTIONAL RELATIONSHIP,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
James R. Wallis.
Water Resources Research, Vol 1, No 4 (1965): 447-461.

Descriptors: *Estimating equations, *Forecasting, *Analytical methods, *Regression analysis, Statistical models, Mathematical models, Mathematical studies, Hydrologic aspects.
Identifiers: Factor analysis, Principal components analysis, Key cluster analysis, Multivariate analysis.

Conventionally hydrologists have used regression analysis for solving their multivariate problems. Recently other multivariate statistical methods have been advocated. This paper discusses and compares the effectiveness of six methods of analysis: regression, principal component, varimax, oblimax, key cluster, and object. Strengths and weaknesses of each method are discussed and the combination of principal component regression with varimax rotation of the factor weight matrix is recommended for an initial analysis of multifactor hydrologic problems.

WHEN IS IT SAFE TO EXTEND A PREDICTION EQUATION--AN ANSWER BASED UPON FACTOR AND DISCRIMINANT FUNCTION ANALYSIS,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
James R. Wallis.
Water Resources Research, Vol 3, No 2, (1967): 375-384.

Descriptors: *Statistical methods, *Forecasting, *Regression analysis, Environmental effects, Sediment yield, Sedimentary petrology.
Identifiers: *Principal components analysis, Linear discriminant functions, Watershed variables.

Prediction equations for hydrologic events developed from one population of observations (watersheds) are often solved for another population that is removed either in time or in space. Predictions of this kind are never certainties, although some predictions are obviously more uncertain than others. This paper proposes an empirical uncertainty classification that may be found useful for separating probably successful from probably unsuccessful extensions of prediction equations. The classification system is illustrated by a prediction equation for suspended sediment discharge developed from some watersheds in California, and by a discriminant function for marine versus nonmarine sediments based upon microelements.

AN INEXPENSIVE RECORDING SETTLING TUBE FOR ANALYSIS OF SANDS,
University of Southern California, Los Angeles.
David W. Felix.
J Sediment Petrol, Vol 39, No 2, pp 777-780, June 1969. 4 p, 4 fig, 1 tab. USGS Contract No 14-08-0001-10862.

Descriptors: *Particle size, *Settling velocity, *Instrumentation, Sieve analysis, Deposition (Sediments), Analytical techniques, Laboratory tests, Calibrations.
Identifiers: Settling tube, Particle size analysis.

An automatically recording settling tube for rapid size analysis of sand can be constructed from Plexiglas tubing, a transducing cell, and a small chart recorder for less than $1100 (1968 prices). It eliminates time consuming processes associated with sieving, and yields data in terms of hydraulic equivalent size. Reproducibility of the arithmetic mean averages 0.09% for several replicate samples. This compares with 1.0% for sieves, and 5% for the Emery Tube. (Knapp-USGS)

CALIBRATION OF THE UNIVERSITY OF SOUTHERN CALIFORNIA AUTOMATICALLY RECORDING SETTLING TUBE,
University of Southern California, Los Angeles. Dept. of Biology.
David O. Cook.
J Sediment Petrol, Vol 39, No 2, pp 781-786, June 1969. 6 p, 5 fig, 2 tab, 9 ref. USGS Contract 14-08-0001-10862.

Descriptors: *Particle size, *Settling velocity, *Instrumentation, *Calibrations, Sieve analysis, Analytical techniques, Laboratory tests.
Identifiers: Settling tube calibration, Particle size analysis.

Calibration of the automatically recording settling tube at the University of Southern California is done by using small groups of glass beads. The settling times are adjusted to a specific gravity of 2.65 and the calibration extrapolated for different temperatures. The calibration does not compensate for interaction among settling grains, but this factor may significantly influence the deposition of aqueous sands. The range of calibration and laboratory error for the settling tube is small compared to the textural variation of natural sands. (Knapp-USGS)

A RAPID METHOD FOR THE DETERMINATION OF SHAPE, SPHERICITY AND SIZE OF GRAVEL FRAGMENTS,
Ibadan Univ. (Nigeria). Dept. of Geology.
Kevin Burke, and S. J. Freeth.
J Sediment Petrol, Vol 39, No 2, pp 797-798, June 1969. 2 p, 3 fig, 2 ref.

Descriptors: *Gravels, *Particle shape, *Particle size, *Instrumentation, *Measurement, Sedimentology, Laboratory tests, Estimating, Dimensions, Test procedures.
Identifiers: Overhead transparency projectors.

The lengths of the 3 major axes of gravel fragments can be determined by placing the fragments over a grid on an overhead projector of the type found in most modern lecture theatres. The particles are spread on sheets of transparent graph paper with their major and intermediate axes approximately parallel to the surface. The minor axis is determined by rotating the particle around its major axis until the smallest projected area is seen. The accuracy is about 1/4 mm. (Knapp-USGS)

DIGITAL-COMPUTER APPLICATIONS CHEMICAL-QUALITY STUDIES OF SUR WATER IN A SMALL WATERSHED,
Geological Survey, Washington, D. C.
Timothy Steele.
Symp on Use of Analog and Digital Comput Hydrol, Tucson, Ariz, Dec 1968, Int As Hydrol, Pub No 80, Vol 1, pp 203-214, 1968. 4 fig, 2 tab, 6 ref.

Descriptors: *Water quality, *Water chem *Small watersheds, *Sampling, *Digital comp Data processing, Data storage and retrieval, ous solutions, Leaching, Weathering, Solutes flow.
Identifiers: San Francisco (Calif).

A program of sampling surface water and ana for the major ionic constituents was carrie over a 15-mo period between June 1966 an tober 1967, in the Pescadero Creek wate California. The 46-sq mi coastal basin, about south of San Francisco, is relatively free of h habitation and agriculture, but geologically plex. Chemical-quality data from the wate despite its complex geology, showed cons relations with specific conductance. Simple r sion equations were developed by graphic analytical methods, to form the basis of a d computer program for estimating solute conc tions and loads from discharge data alone. solute concentrations were plotted against stream discharge, trends were consistently throughout the range of discharges for Na, K Cl concentrations, but a characteristic bre trends from low to high discharges was d discernible for Ca, Mg, bicarbonate, sulfate calculated dissolved-solids concentrations may result from the different chemical proc that prevail during base flow under predomi direct-runoff flow. The linear trends are part plained by the increasing solute contributio groundwater in the lower part of the wate Concentrations-discharge regression equa were derived for the base-flow component a the direct-runoff component. Relative propo of solute concentrations contributing to specific conductance changed rather abruptly low- to high-discharge levels. High specific ductances reflected larger percentage con tions by Na and Cl ions and corresponding st contributions by Ca and sulfate ions. The app and methods used in this study might be ext to other small watersheds quite different in ge and climatology in search of correct quanti interpretation and prediction of the effec hydrochemical processes in nature.

tifiers: *Hybrid computers.

digital computer programs TELMA 1 and MA 2 written at General Electric TEMPO for imulation of groundwater basins are described. e programs have some features of interest not lable in other digital simulation programs. Exence in attempting to verify the groundwater in an actual basin using TELMA 1 is ented. Available data, both geohydrological concerning historic recharge and production, be supplemented most effectively by using a lation model to guide the collection of new ination. The existing data can be much more ningfully and economically utilized by inucing mathematical optimization techniques as id in model building. This approach assumes nsive use of digital computation in the preparaof models but does not preclude the possibility nalog or digital-analog hybrid computers after uate models have been developed. It is coned that simulation is the only practical way to utilize present data and guide the develop- of better understanding of groundwater flows for direct management purposes and as a ns of improving geohydrological knowledge. app-USGS)

tifiers: Rainfall data plotting.

ortran IV program has been developed to plot yetal lines from precipitation data of given sta-s. Points on the isohyetal lines are determined inear interpolation between stations. Once the yetal points were obtained, their proper ience was determined. This was performed by ing with a certain point and checking the ts successively nearest to it for a permissible ection between the two points. Then the ience of points was checked for possible loop-or connection with other sequences of points of same precipitation. The isohyetal lines were smoothed by successive parabolic approximations. Volume of precipitation can be calculated within any specified boundary. It is possible to calculate volumes of precipitation over sub-zones of a given area. The volume is obtained by summing the product of the area between two precipitation lines and the average precipitation value of the lines. The area between the isohyetal lines is found by dividing the region into straight line trapezoidal segments and summing the areas of the trapezoids. (Knapp-USGS)

HYPOTHETICAL FLOOD COMPUTATION FOR A STREAM SYSTEM,
Corps of Engineers, Sacramento, Calif. Hydrologic Engineering Center.
Leo R. Beard.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Int Ass Sci Hydrol, Pub No 80, Vol 1, pp 258-267, 1968. 10 p, 4 fig, 1 tab.

Descriptors: *Routing, *Flood forecasting, *Computer programs, Runoff forecasting, Synthetic hydrology, Snowpacks, Snowmelt, Water loss, Hydrograph analysis, Regulation, Urbanization, Rainfall-runoff relationships.
Identifiers: U.S. Army Corps of Engineers.

One of the computer packages being developed in The Hydrologic Engineering Center of the Corps of Engineers is the Flood Hydrograph Package, which performs all common operations in deriving and using flood hydrographs entirely in core storage of computers as large as the IBM 7094. One of the problems managed by this program is flood computation throughout an entire stream system in one operation. Ordinarily, a design or hypothetical flood might be derived from a storm centered in the tributary area. After floods are computed in this manner for several subareas within a stream system, it is often necessary to compute floods for the combined areas at various locations. The originally computed floods cannot be routed and combined, since the storm cannot center over all subareas at once. It is ordinarily necessary to recompute each subarea flood for every combining point downstream, and to label each recomputation as the contribution to that particular location. In a complex system, such as a storm drain or major river basin, this procedure would lead to great amounts of computation and considerable confusion. Essential features of the computer package and the simplified stream system analysis are described. (Knapp-USGS)

Identifiers: Great Lakes regulation, Canada, United States.

The regulation of one or more of the Great Lakes has been under investigation sporadically for over 50 years by various agencies in Canada and the United States. Only in the last 3 years, however, in an international investigation, has the development and use of computers permitted study of many alternative regulations schemes utilizing all of the lakes while computing economic effects on the diverse interests. The various computer programs used in obtaining the material flow-level model and in deriving and testing forecasting and simulation techniques are discussed. Methodology as applied to the determination of economic effects is also considered in optimizing alternative schemes of regulation. A study of great complexity can be performed within tight scheduling with proper balance of technical personnel and equipment. (Knapp-USGS)

COMPUTER DOCUMENTATION AND RETRIEVAL OF HYDROLOGIC INFORMATION FOR SMALL GROUPS OR INDIVIDUALS,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Henry W. Anderson, and Theodore B. Yerke.
Int Ass Sci Hydrol Publ 81 (1968): 550-560.

Descriptors: *Information retrieval, *Bibliographies, *Publications, Research facilities, Computer programs, Automation, Data storage and retrieval, Hydrologic aspects.
Identifiers: Citations, Search, Abstracting, Computer aided documentation.

Computer programs have been developed which will allow the individual researcher, forester, or engineer to classify, store, and retrieve literature, abstracts, meeting notes etc. Use of one of the programs, the 'search program' in preparing a summary of sedimentation research in the U. S. is illustrated. Included is a discussion on what to document, indexing for information retrieval, and abstracting techniques. A list of 17 sources of keywords and descriptors of hydrologic and related terms is appendixed.

SUGGESTIONS ON COMPILATION OF SMALL SCALE HYDROGEOLOGICAL MAPS,
Sen So-yung.
Int Geol Rev, Vol 11, No 4, p 419-427, Apr 1969. 9 p, 16 ref, append. Transl from Acta Geol Sinica, Vol 45, No 3, pp 325-336, 1965.

Descriptors: *Hydrogeology, *Mapping, *Groundwater, *Surface waters, Distribution patterns, Hydrography, Surveys, Terrain analysis, Streams, Lakes, Aquifers, Water levels.
Identifiers: Hydrogeological maps, China.

Regional hydrogeological maps may be divided into 2 types, those expressing complex, and those expressing special factors. Complex small scale regional hydrogeological maps (1:1,000,000 and less) should expose the main features of regional hydrogeology, but also provide sufficient information to show concrete hydrogeological conditions. When distinguishing 'regional hydrogeological types,' we must take into account the geomorphological conditions, lithology and occurrence of aquifers, water quality, depth of underground water tables, underlying aquifers, special hydrogeological phenomena (salinization and swamping of soils, areas of artesian flow, etc.) and geological age or types of genesis of aquifers. Hydrogeological divisions include hydrogeological regions, subregions, terrains, and subterrains. The regional hydrogeological types are to be shown on the map by using different colors and tints and with various patterns as well; areas of hydrogeological divisions are to be traced only with boundary lines. GAMMA CORRELATION AND ITS USE IN COMPUTATIONS OF LONG-TERM STREAMFLOW REGULATION,
State Hydrological Inst., Leningrad (USSR).
Ye G. Blokhinov, and O. V. Sarmanov.
Soviet Hydrol: Selec Pap, Issue No 1, p 36-54, 1968. 19 p, 7 fig, 2 tab, 5 ref. From Trudy Gos Gidrol Inst, No 143, p 110-133, 1968.

Descriptors: *Statistical methods, *Correlation analysis, *Water management (Applied), Reservoir operation, *Reservoir design, Streamflow forecasting, Regulation.
Identifiers: *USSR, Gamma correlation.

The use of gamma distribution computation in correlating streamflow to make water management decisions is discussed. The main characteristics of a two-variate gamma distribution and working relationships needed for practical purposes are presented for a symmetric case, that is, when the values being correlated have the same parameters. The order in which the gamma correlation is used in computations of long-term streamflow regulation for selected major reservoir parameters is examined and an estimate is given of the possible water management effect obtained from its use. (Knapp-USGS)

PATTERNS OF SUCCESSION OF DRY AND WET YEARS AS A BASIS FOR COMPUTATIONS OF STREAMFLOW REGULATION,
State Hydrological Inst., Leningrad (USSR).
D. Ya. Ratkovich.
Soviet Hydrol: Selec Pap, Issue No 1, p 55-79, 1968. 25 p, 7 fig, 3 tab, 8 ref. From Trudy Gos Gidrol Inst, No 143, p 76-105, 1968.

Descriptors: *Statistical methods, *Correlation analysis, *Stochastic processes, *Markov processes, *Water management (Applied), Streamflow forecasting, Regulation, Reservoir operation.
Identifiers: Streamflow regulation.

The probability distribution of groups of various durations in limited samples of independent random values relative to some fixed value of a random quantity coincides with relationships characteristic of the population, provided the ends of a sample close circularly. This makes it possible to determine to what degree the results of water management computations, based on calendar series of hydrologic values, are free of systematic errors. The probability distribution depends on the number of terms in a sample and deviates more from relationships characteristic of the population in shorter samples. To verify the hypothesis that annual streamflow series can be regarded as sequences of independent random values, we must compare the distribution of groups of various duration in samples of independent random values with the recurrence of groups of dry and wet years actually observed in rivers. The distribution of groups of dry and wet years may differ from each other and differ in rivers that differ in flow formation conditions or belong to different physiographic regions. (Knapp-USGS)
W69-08613

SOME STATISTICAL METHODS IN THE ANALYSIS OF HYDROLOGIC SERIES,
State Hydrological Inst., Leningrad (USSR).
S. N. Kritskiy, and M. F. Menkel.
Soviet Hydrol: Selec Pap, Issue No 1, p 80-98, 1968. 19 p, 1 fig, 16 ref. From Trudy Gos Gidrol Inst, No 143, p 110-133, 1968.

Descriptors: *Statistical methods, *Correlation analysis, *Probability, *Streamflow forecasting, Sampling, Regression analysis, Parametric hydrology, Water management (Applied), Regulation, Markov processes, Stochastic processes.
Identifiers: Gamma distributions.

Some relationships between probability distribution parameters and method of estimating parameters that allow for the relatively small volume of samples and the correlation between contiguous terms are examined. The use of regression to reduce the characteristics of flow series to long-period values, the correlations between contiguous terms of simple Markov chains and their differences, and the refinement of formulas of standard errors in a sample estimate of the parameters of a gamma distribution are discussed. 8B. Hydraulics

UNSTEADY FLOW IN A RESERVOIR-CONDUIT SYSTEM,
Kansas Univ., Lawrence; and Whirlpool Corp., St. Joseph, Mich.
Yun-Sheng Yu, and Mack H. Gray, III.
OWRR Project No A-017-KAN. Water Resources Res, Vol 5, No 3, pp 660-672, June 1969. 13 p, 8 fig, 4 tab, 11 ref.

Descriptors: *Unsteady flow, *Closed conduit flow, Pipe flow, Reservoirs, Hydraulics, Hydraulic structures, Velocity, Flow, Pressure, Reynolds number.
Identifiers: Pipe-flow acceleration.

The one-dimensional method of solution computes successfully the instantaneous average displacement, velocity, and acceleration of fluid in a pipe connected to a reservoir, and the water depth in the reservoir when a valve at the end of the pipe is suddenly opened. Measurements of the instantaneous average fluid displacement in the pipe for different values of B/D (reservoir diameter to pipe diameter) agree very well with the computed values. For a specific inlet geometry and a given value of the ratio of pipe length to pipe diameter, the lumped inertial parameter decreases as B/D increases and reaches a minimum value as B/D becomes infinity. The neglect of the inertia of fluid in the reservoir in computing the unsteady flow characteristics is justifiable if B/D is larger than 90 and L/D much larger than 0.47. (Knapp-USGS)

A NONDIMENSIONAL APPROACH TO THE FLOW OF WATER IN FLUMES AND CANALS,
Mississippi State Univ., State College. Dept. of Agricultural and Biological Engineering.
B. P. Verma, and J. C. McWhorter.
Completion Report, Mississippi Water Resources Research Institute, July, 1969. 37 p, 3 tab, 4 fig, 7 ref, 1 append. OWRR Project A-024-MISS.

Descriptors: *Dimensional analysis, *Uniform flow, *Open channel, Flow equation.

This study develops a reliable relation for describing uniform turbulent flow of water in flumes and canals. The study involves: A dimensional analysis using the physical quantities which apply to the common case of uniform turbulent flow in a prismatic open channel; the conduct of a uniform flow experiment; the analysis of the data in order to establish a prediction equation that describes uniform flow; and the comparison of the prediction equation with data obtained from the literature on uniform flow in flumes and canals. The analysis of experimental flume data and data compiled from the literature produced a prediction equation, the form of which, describes the case of uniform flow without relying upon constants which are dimensionally questionable.

BASIC STUDY OF JET FLOW PATTERNS RELATED TO STREAM AND RESERVOIR BEHAVIOR,
Illinois Univ., Urbana.
W. Hall, C. Maxwell, and H. Paxwash.
Water Resources Center, Research Report No 10, July 1967. 63 p. OWWR Project A-010-Ill.

Descriptors: *Diffusion, *Flow characteristics, *Flow profiles, *Free surfaces, Air-water interfaces, *Jets, Boundary (Surfaces), Hydraulics, Interfaces.

The effect of a nearby free surface on jet flow is studied experimentally. Parameters varied included nozzle diameter, submergence, and discharge. The jets were discharged into still ambient fluid of the same density. The maximum velocity is found to move upward as the jet proceeds downstream eventually reaching the surface. The resultant wave action modified flow patterns in the upper region of the jet, though the velocity distribution in the lower portion resembles that for deeply submerged jets. The location of the filaments of maximum velocity was found to be a function of both absolute submergence as well as submergence relative to the nozzle diameter. Intakes placed near the nozzle had no measurable influence on jet flow patterns. (Benedict-Vanderbilt)

ON A MOMENTUM-MASS FLUX DIAGRAM FOR TURBULENT JETS, PLUMES AND WAKES,
Manchester Univ. (England).
B. R. Morton.
Journal of Fluid Mechanics, Part I, Vol 10, p 101-112, Feb 1961. 4 fig, 7 ref.

Descriptors: *Jets, *Buoyancy, Continuity equation, Momentum equation, Mathematical model, Hydrodynamics, Turbulent flow, Eddies, Reynolds number.
Identifiers: *Entrainment, Momentum flux, Mass flux, Wakes, Analytic solution, Density deficiency, Virtual source, Top-Hat profiles, Drag coefficient, Similarity assumptions, Buoyant plumes.

Many salient features of fully developed turbulent jets, plumes and wakes with steady mean flow can be shown clearly by the relationship between the momentum flux and the mass flux in the column of moving fluid. Using a simple model for the flows, this relationship can be theoretically predicted from the solution of a single ordinary differential equation, and the character of many related flows can be represented on a single momentum-mass flux diagram. Theoretical turbulent jets and wakes in a still fluid environment and in a steady ambient stream are represented on the same mass-momentum flux diagram along with buoyant wakes and plumes (buoyant jets). Chosen as examples are (1) a negatively buoyant jet of heavy fluid with strong deceleration, (2) a weaker negatively buoyant jet, (3) a buoyant jet with very weak negative buoyancy, (4) a positively buoyant jet, (5) a forced wake, and (6) a more weakly buoyant forced wake showing transition to jet flow at a distance. Also presented are curves for the dimensionless velocity excess in the jet relative to the ambient fluid and for the dimensionless jet radius plotted against dimensionless distance from a virtual source. The author suggests that the value of the entrainment coefficient, defined as the ratio of the inflow velocity to the velocity difference between jet and ambient flows, is approximately 0.116. (Motz-Vanderbilt)

behavior, Latent heat, Vapor pressure, Wind velocity, Dye releases, Reynolds number, Turbulent flow, Convection, Temporal and spatial distributions.
Identifiers: *Entrainment, *Richardson number, *Horizontal surface jet, Similarity assumptions, Back radiation, Stefan-Boltzmann law, Lab data.

Experiments are performed on the diffusion of warm water jets discharged horizontally at the surface of quiescent water. The initial temperature difference between the jet and the ambient fluid varies from 0.2 to 28 deg C., the densimetric Froude number at the jet outlet varies from 16.1 to 1.4, and the Richardson number (Ri) at the jet outlet varies from 0.00 to 0.54. An approximate theory is developed with the main assumptions that: (1) The horizontal diffusion terms in the equation of motion equal the horizontal pressure gradient term; (2) The profiles of temperature in vertical sections are similar and the profiles of horizontal velocity in vertical sections are also similar; (3) The rate of entrainment at the bottom of the surface layer of warm water is proportional to some characteristic velocity at that vertical plane; (4) The turbulent-diffusion coefficients are constants. An approximate solution is presented for the case of the Ri number greater than 1, or for the case of no vertical entrainment. The experimental results are compared with the predicted results, and the effect of the Ri number on the diffusion of warm water jets is noted. When the Ri is greater than 1, surface heat exchange is important; when the Ri is less than 1, vertical entrainment is important. (Motz-Vanderbilt)

LUENING V PUBLIC SERVICE COMMISSION (PERMIT TO CONSTRUCT HYDROELECTRIC DAM).

267 Wis 537, 66 NW 2d 190-192 (1954).

Descriptors: *Wisconsin, *Dams, *Canals, *Hydroelectric plants, Discharge, Hydroelectric power, Dam construction, Rivers, Navigation, Navigable waters, Public rights, Public health, Permits, Natural flow, Riverbeds, Boating, Fishing, Legal aspects, Judicial decisions, Administrative agencies, Local governments.
Identifiers: Rapids.

Plaintiffs instituted suit to review an order issued by the public service commission granting a permit to construct a dam and canal for hydroelectric purposes. The plaintiffs contended that the commission could not authorize the construction of the canal and were only empowered to authorize the construction of a dam across the river bed. The court held that the term 'dam' is not limited to the structure across the river bed but includes the canal which carries the water through the generating plant and back to the river bed. The court held that if the commission found, after a hearing, that the proposed dam would not interfere with navigation or violate other public rights, that it could grant a permit. The evidence adduced at the hearing indicated that the river was not suited for boating and fishing and thus substantiated the commission's conclusions. The court determined that the proposed canal could be used for navigation and thereby replace the river in that respect. The action of the public service commission was upheld. (Shevin-Fla)

FUTURE ECONOMICS RESEARCH ON WESTERN WATER RESOURCES -- WITH PARTICULAR REFERENCE TO CALIFORNIA,
W69-08383 06B

NORTH CAROLINA UNIV., CHAPEL HILL.
RESEARCH ON COMPREHENSIVE PLANNING OF WATER-RESOURCE SYSTEMS,
W69-08382 06B

NORTH CAROLINA UNIV., CHAPEL HILL. DEPT. OF ENVIRONMENTAL SCIENCES AND ENGINEERING.
ELIMINATION OF IODINE, COBALT, IRON, AND ZINC BY MARINE ZOOPLANKTON,
W69-08523 05C

ELIMINATION AND TRANSPORT OF COBALT BY MARINE ZOOPLANKTON
W69-08529 05C

NORTH TEXAS STATE UNIV., DENTON. DEPT. OF BIOLOGY.
BIOLOGICAL CONCENTRATION OF PESTICIDES BY ALGAE,
W69-08565 05C

OAK RIDGE NATIONAL LAB., TENN. CHEMISTRY DIV.
OBSERVED DIFFRACTION PATTERN AND PROPOSED MODELS OF LIQUI WATER,
W69-08560 01A

OFFICE DE LA RECHERCHE SCIENTIFIQUE ET TECHNIQUE OUTRE-MER, PARIS (FRANCE).
DESCRIPTION OF THE HYDROLOGIC REGIME OFF THE GRAIN AND IV COASTS BETWEEN ABIDJAN AND MONROVIA (FRENCH),
W69-08255 02L

OREGON STATE GAME COMMISSION, CORVALLIS. RESEARCH DIV.
PRODUCTION OF JUVENILE STEELHEAD TROUT IN A FRESHWATER IMPOUNDMENT,
W69-08517 02H

OREGON STATE UNIV., CORVALLIS AND BATTELLE-NORTHWEST, RICHLAND, WASH. PACIFIC NORTHWEST LAB.
METABOLISM OF ZINC-65 IN EUPHAUSIIDS,
W69-08276 05C

OREGON STATE UNIV., CORVALLIS. DEPT. OF AGRICULTURAL ECONOMICS AND OREGON STATE UNIV., CORVALLIS. WATER RESOURCES RESEARCH INST.
CONCEPTUAL ISSUES IN THE CONDUCT OF REGIONAL RESEARCH ON ECONOMICS OF WATER,
W69-08386 06B

OREGON STATE UNIV., CORVALLIS. DEPT. OF OCEANOGRAPHY.
RADIOZINC DECLINE IN STARRY FLOUNDERS AFTER TEMPORARY SHUTDOWN OF HANFORD REACTORS,
W69-08270 05C

THE EFFECT OF TEMPERATURE, SEDIMENT, AND FEEDING ON THE BEHAVIOR OF FOUR RADIONUCLIDES IN A MARINE BENTHIC AMPHI
W69-08522 05C

RADIOISOTOPE MEASUREMENTS OF THE VISCERA OF PACIFIC SALMO
W69-08530 05C

ZINC-65 IN ECHINODERMS AND SEDIMENTS IN THE MARINE ENVIRONMENT OFF OREGON,
W69-08531 05C

OREGON STATE UNIV., CORVALLIS. PACIFIC COOPERATIVE WATER POLLUTION AND FISHERIES RESEARCH LABS.
EXPERIMENTS ON THE DISSOLVED OXYGEN REQUIREMENTS OF COLD-WATER FISHES,
W69-08516 05C

OTTAWA UNIV., ONTARIO. DEPT. OF GEOLOGY.
THE SEDIMENTOLOGY OF A BRAIDED RIVER,
W69-08580 02J

PENNSYLVANIA STATE UNIV., UNIVERSITY PARK. DEPT. OF GEOLOG AND GEOPHYSICS AND NATIONAL IRANIAN OIL CO., NEW YORK.
A CONTACT GAGE FOR RAPID AND ACCURATE THREE-DIMENSIONAL GRAIN SIZE MEASUREMENT OF LOOSE SAND PARTICLES,
W69-08584 07B

PENNSYLVANIA STATE UNIV., UNIVERSITY PARK. DEPT. OF SOIL TECHNOLOGY.
CROP RESPONSE TO SEWAGE EFFLUENT,
W69-08617 05D

PENNSYLVANIA STATE UNIV., UNIVERSITY PARK. INST. FOR RESEARCH ON LAND AND WATER RESOURCES.
CRUSHED LIMESTONE BARRIERS A BASIC FEASIBILITY STUDY I THE NEUTRALIZATION OF ACID STREAMS,
W69-08376 5G

RENOVATION OF WASTE WATER THROUGH APPLICATION TO AGRICULTURAL CROPLAND AND FORESTLAND,
W69-08377 05D

WATERSHED THERMAL CLIMATES AND WATER LOSS PREDICTION,
W69-08378 02D

BIOLOGICAL OXIDATION RATES IN MINE ACID WATER REGIMES,
W69-08379 05G

AN INVESTIGATION OF POTENTIAL INTERACTIONS OF COAL AND C PRODUCTS FOR USE IN THE TREATMENT OF MINE DRAINAGE WATER
W69-08466 05D

PUBLIC HEALTH SERVICE, PHILADELPHIA, PA. DELAWARE ESTUARY COMPREHENSIVE STUDY.
MATHEMATICAL MODEL FOR DISSOLVED OXYGEN,
W69-08532 05D

PUBLIC HEALTH SERVICE, ROCKVILLE, MD. DIV. OF ENVIRONMENT HEALTH.
PUBLIC HEALTH FACTORS IN REACTOR SITE SELECTION,
W69-08216 05G

PUERTO RICO NUCLEAR CENTER, MAYAGUEZ.
THE NATURE OF THE DISTRIBUTION OF TRACE ELEMENTS IN LONG

HOVY (ANCHOA LAMPROTAENIA HILDEBRAND), ATLANTIC THREAD
RING (OPISTHONEMA OGLINUM LASUEUR), AND ALGA (UDOTEA
BELLUM LAMOUROUX),
-08525 05C

O RICO NUCLEAR CENTER, MAYAGUEZ. MARINE BIOLOGY
M.
E ELEMENT COMPOSITION OF INSHORE AND OFFSHORE BENTHIC
LATIONS,
-08528 05C

ON CO., WALTHAM, MASS.
APPLICATION OF LINEAR PROGRAMMING TO EFFICIENCY IN
ATION OF A SYSTEM OF DAMS,
-08536 04A

G UNIV. (ENGLAND). SEDIMENTOLOGY RESEARCH LAB.
IONAL CURRENT MARKS OF WEAKLY COHESIVE MUD BEDS,
-08579 02J

CH INST. FOR WATER RESOURCES DEVELOPMENT, BUDAPEST
RY).
PROBLEMS OF STREAMFLOW FORECASTS BASED ON INFORMATION
ORY,

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

se of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY OF THE UNIVERSITY OF VIRGINIA

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

HYDROLOGY OF THE USSR ARID REGIONS (RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
K. P. Voskresenskiy.
Trudy Gos Gidrol Inst, No 163, p 19-29, 1968. 11 p, 2 tab.

Descriptors: *Hydrology, *Arid lands, Humidity, Air circulation, Water resources, Water supply, Water users, Discharge (Water), Precipitational (Atmospheric), Climates, Water loss, Filtration, Desalination, Hydraulic engineering, Soils, Evaporation.
Identifiers: *USSR, Arid regions.

The author describes the over-all picture of USSR river discharges, with special attention given to the river discharges of the Aral-Caspian, CisAsov, and Barabinsk-Achinsk-Yeniseysk regions considered to be the dryest ones in the Soviet Union. The Pacific and Arctic Ocean basins are characterized by a runoff of 10.5 lit/sec per sq km, whereas the dry basins contribute only from 0.1 to 2.0 lit/sec per sq km. The author points out that these arid regions, in spite of their lack of water resources, are of importance in the economy of the USSR. Several steps are suggested to increase the supply and use of fresh waters in the arid regions. (Gabriel-USGS)

THE EFFECTS OF DENSITY OF RECORDING RAIN GAUGE NETWORKS ON THE DESCRIPTION OF PRECIPITATION PATTERNS,
California Univ., Davis. Dept. of Water Science and Engineering.
J. Amorocho, A. Brandstetter, and Don Morgan.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 189-202, 1968. 14 p, 6 fig, 6 tab, 2 ref.

Descriptors: *Networks, *Rain gauges, *Distribution patterns, *Rainfall-runoff relationships, *Depth-area-duration analysis, Model studies, Mathematical models, Statistical methods, Hydrologic data, Hyetographs, Hydrographs, Radar, Rainfall disposition.
Identifiers: Rain gauge networks, Hydrologic models.

Methods based on mathematical filtering processes applied to data from dense recording precipitation gage networks have led to the development of criteria for the determination of the effect of network densities on the definition of significant storm patterns. The application of 1 of these procedures to the analysis of storms in the Central Valley of California is reported. The experiments involve the use of over 20 battery-driven, digital recording rain gauges distributed in a special array covering an area of approximately 10 sq mi. The evolution of the storm precipitation patterns over the area is investigated by means of the data from the network in conjunction with radar echo observations. The spacings required for adequate areal pattern definition were studied, and a procedure for the correction of systematic local effects on each rain gauge was found to be sufficient to make the individual gauge data hydrologically equivalent. (Knapp-USGS)
W69-08931

RAINFALL INPUT FOR HYDROLOGIC MODELS,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
David M. Hershfield.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 177-188, 1968. 12 p, 12 fig, 1 tab, 4 ref.

Descriptors: *Rainfall-runoff relationships, *Duration curves, *Depth-area-duration analysis, Hydrologic data, *Networks, Rain gages, Model studies, Hyetographs, Hydrographs, Hydrograph analysis, Distribution patterns, Storms, Runoff, Correlation analysis.
Identifiers: Rainfall models, Hydrologic models.

A study of more than 300 rainstorms, 15 major events in each of 23 densely gaged watersheds, shows that direction of rain gage distribution is often more important than gage density in defining the characteristic dimensions of the rainfall distribution. Rainfall volume appears to be estimated adequately with only a small number of properly located gages as compared with that required for good definition of the isohyetal pattern. The depth-area curves for individual storms are generally similar in shape and direction within a watershed.

Examples are presented of time distribution and rainfall progression over the watershed. (Knapp-USGS)

TERRESTRIAL, ATMOSPHERIC AND SOLAR RADIATION FLUXES ON A HIGH DESERT MOUNTAIN IN MID-JULY: WHITE MOUNTAIN PEAK, CALIFORNIA,
California Univ., Los Angeles. Dept. of Geography.
Werner H. Terjung, Ronald N. Kickert, Gerald L. Potter, and Stanley W. Swarts.
Solar Energy, Vol 12, No 3-F, p 363-375, 1969. 13 p, 8 fig, 2 tab, 17 ref.

Descriptors: *Solar radiation, *Climatology, *California, Hydrologic cycle, Weather, Meteorology, Energy budget.
Identifiers: White Mountain Peak (Calif).

Solar radiation was measured on White Mountain Peak, California, in July at an altitude of 14,000 feet. The summed net radiation was about 575 ly and heat flux into ground was about 14 ly. Such high solar radiation is more than theory predicts for the location, and possibly the highest recorded on the Earth's surface. (Knapp-USGS)

2B. Precipitation

MEASUREMENT AND ESTIMATION OF PRECIPITATION ON EXPERIMENTAL WATERSHEDS,
Forest Service (USDA), Berkeley Calif. Pacific Southwest Forest and Range Experiment Station.
Edward S. Corbett.
International Symposium on Forest Hydrology, Proceedings, Pennsylvania State University, p 107-129, Aug 29-Sept 10, 1965.

Descriptors: *Precipitation (Atmospheric), *Precipitation gages, *Measurement, Demonstration watersheds, Rain, Sampling, Gaging stations, Isohyets, Variability, Climatic data, Network design, Theis equation.
Identifiers: Point sampling, *Experimental watersheds.

The literature pertinent to the measurement of precipitation (primarily rainfall) on watersheds is reviewed. Topics discussed include types of rain gages, accuracy of point rainfall measurements, selection of rain gage sites, precipitation variability and its effects on rain gage network designs, and extrapolation of point precipitation values to areal estimates. PROBLEM OF THE STATISTICAL STRUCTURE OF THE FIELD OF WINTER PRECIPITATION,
Main Geophysical Observatory, Leningrad (USSR).
A. I. Polishchuk.
Soviet Hydrol: Selec Pap, Issue No 2, p 147-149, 1968. 3 p, 2 fig, 1 tab, 8 ref. Trans Trudy Gos Geophys Observ, No 215, p 153-156, 1968.

Descriptors: *Precipitation (Atmospheric), *Correlation analysis, *Precipitation gages, Networks, Statistical methods, Snowfall, Rainfall, Rainfall disposition, Winter.
Identifiers: *USSR, Precipitation structure (Statistical).

The statistical structure of winter precipitation at 15 USSR precipitation stations was analyzed. Methods of correction of monthly precipitation sums were evaluated. The space correlation function was found by averaging the correlation coefficients for pairs of stations and relating the average correlation coefficients to station separation distance. Correlation coefficients are tabulated, and correlation functions are shown by graphs. (Knapp-USGS)

MICROSPHERULES IN SNOW AND ICE-FOG CRYSTALS,
Army Terrestrial Sciences Center, Hanover, N.H.
Motoi Kumai.
Cold Reg Res and Eng Lab Res Rep No 245, Mar 1969. 10 p, 4 fig, 2 tab, 29 ref.

Descriptors: *Precipitation (Atmospheric), *Nucleation, *Ice, *Snow, *Fog, Arctic, Cold regions, Alaska, Freezing, Clays, Air pollution, Smoke.
Identifiers: Ice crystal nucleation, Ice fog, Microspherules.

Spherules found in snow crystals, ice-fog crystals, fallout particles, and fly ash were studied with an electron microscope using the electron diffraction method. The central part of the residues of 1004 specimens of natural snow crystals from Greenland, the United States, and Japan were examined; 14 spherules 0.1 to 1.5 microns in radius were found among them. The residues of 658 artificial ice-fog crystals formed from water vapor in flue gases of coal-burning electric power plants at Fairbanks, Alaska, were also examined; 9 spherules were found. Spherules similar to those found in ice-fog residues were found in furnace-produced fly ash fallout at Fairbanks, Alaska. The electron microscope study indicated that less than 0.7% of the 1004 snow crystals are formed mainly on clay mineral particles by heterogeneous nucleation. (Knapp-USGS)

OBJECTIVE ASSESSMENT OF ADEQUATE NUMBERS OF RAINGAUGES FOR ESTIMATING AREAL RAINFALL DEPTHS,
British Meteorological Office, Bracknell (England).
P. M. Stephenson.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 252-264, 1968. 13 p, 8 fig, 7 tab, 3 ref.

Descriptors: *Network design, *Rain gages, *Rainfall disposition, *Distribution patterns, *Statistical methods, Hydrologic data, Regression analysis, Correlation analysis, Probability, Isohyets, Estimating.
Identifiers: *United Kingdom, Rain gage distribution, Rain gage networks.

The assessment of the minimum number of raingages required to measure the depth of rainfall over an area within given limits of accuracy is discussed. Standard computations are not necessarily universally applicable and need to be related to the type of precipitation and the nature and size of the particular area under consideration. An approach is suggested to a solution of the problem for monthly rainfall using a largely objective statistical technique for different classes of precipitation over areas of England and Wales varying in size from a few tens of square kilometers to the whole country. The results are presented in graphical and tabular form, relating the minimum number of gages required to size of area. For small areas the results are in close accord with those previously determined empirically and used in the British Meteorological Office for planning networks. For larger areas considerable fewer gages than customarily recommended appear to be adequate. An appendix gives the results of other approaches to the problem using more limited data but also attempting a solution for daily rainfall. (Knapp-USGS)

Identifiers: *Dendroclimatology.

The plant-physiological basis for expecting a tree-ring growth in appropriate environments related to climate is briefly reviewed. Emph placed upon statistical techniques designed late tree-ring growth indices to observed cli parameters. Four major problem areas for st cal analyses are specified and new techn described. These are (1) the objective class tion of the sampled tree sites as to sensitivit other desirable characteristics for dendrocli purposes, (2) the removal of growth trend sumed unrelated to climated variation, (3 selection of a linear multiple regression specifying that combination of climatic ele best related to tree-ring index series, and (4 amination of the spatial- and temporal-scale tions in the regression relation. The optimum specified by the characteristics of the sampled ring series are best related to a weighted com tion of precipitation preceding the growing se Time-scale fluctuations with periods shorter 10 yr are somewhat better related than l period fluctuations. Spatial variability is appa complicated, but statistically significant regre relations can be found for optimum sites up km from the precipitation recording station derived relationships are used to attempt th trapolation of relevant precipitation sta backward in time for semi-arid regions o Western United States. tifiers: *Ice fog, Fairbanks (Alaska).

ng January and February of 1962-64, Fair- s, Alaska, and vicinity was the site of a series udies dealing with ice fog and ice crystals. ılts of an investigation of the amount and ex- of air pollution and ice fog in the area are ented with special emphasis on reducing ice by decreasing the water vapor being emitted into the atmosphere. The major sources of water vapor at the 2 military installations in the region, Fort Wainwright and Eielson AFB, are the heating and powerplants and their associated cooling ponds. In the populated areas around Fairbanks, a high aerosol concentration of about 100,000 particles/cu cm exists, whereas in the uninhabited areas the concentration is extremely low (about 300 particles). Much of the high concentration is due to the burning of coal for heat and power. Because the coal is of low grade it also emits about 350,000 kg of water vapor into the atmosphere on a day when the temperature is -40C. This water vapor condenses on the aerosols and produces ice fog. Anthracite or semi-bituminous coal would reduce the water vapor output to only 1/5 of the amount produced by the low grade coal. Water vapor from cooling ponds can be reduced by freezing the surfaces of the ponds. (Knapp-USGS)

INFLUENCE OF TOPOGRAPHY ON RAINFALL IN WEST VIRGINIA,
West Virginia Univ., Morgantown, W. Va. Water Research Inst.
C. R. Grafton, and W. H. Dickerson.
Water Research Institute Bulletin 1, 1969. 45 p. OWRR Project A-006-WVA.

Descriptors: *Rainfall, *Rainfall disposition, *Distribution patterns, *Topography, *Statistical models, Elevation, Climatic zones, Regression analysis, Correlation analysis, West Virginia.
Identifiers: *Rainfall patterns, *Topographic influences, Computed estimation values.

The influence of topography and geographical position on mean annual precipitation was investigated by correlation and regression analysis. Of the several influences studied, elevation above sea level (actually elevation squared), latitude, and climatic division elevation deviation (a measure of the difference in elevation of the station and the mean elevation for its climatic division) proved to be the most important for the Eastern Zone. For the Western Zone, elevation, rise (a measure of the difference in elevation between the location and nearby higher land forms), and climatic division (indexed by the mean rainfall for the division in which the station was located) were the most significant of the independent variables tried. The zone dichotomy was based on a division of the state into lee and windward areas with the line of demarcation running generally northeast--southwest along the highest elevations of the mountains. Elevation accounted for about 50 percent of the variance in annual precipitation and the coefficient of multiple determination was increased to 0.66 and 0.60 (Eastern and Western Zone, respectively) by inclusion of the additional parameters. SEISMIC INVESTIGATION OF ICE PROPERTIES AND BEDROCK TOPOGRAPHY AT THE CONFLUENCE OF TWO GLACIERS, KASKAWULSH GLACIER, YUKON TERRITORY, CANADA,
Ohio State Univ. Research Foundation, Columbus. Inst. of Polar Studies.
Gilbert Dewart.
Ohio State Univ Inst of Polar Studies Rep No 27, Sept 1968. 207 p, 40 fig, 8 tab, 149 ref.

Descriptors: *Ice, *Glaciers, *Bedrock, *Topography, Heat balance, Energy, Seismic studies, Anisotropy, Valleys, Winds, Air temperature, Crystallography, Geology, Climates, Physical properties, Fissures (Geology), Structural analysis.
Identifiers: *Canada, Kaskawulsh Glacier, Yukon Territory.

The purpose of this study was (1) to investigate seismic velocity inhomogeneity and anisotropy in strongly deformed glacier ice; and (2) to determine the form and dimensions of that part of a sub-glacial valley where 2 large temperate glaciers merge. Noise detecting seismographs, boreholes, geological studies, and refraction and reflection seismic surveys were utilized in the area. The seismic noise in the glacier area is due to wind action, and the mean P-wave and S-wave velocities in the glacier at depths 10-100 m are 3.63 km and 1.74 km/sec, respectively. From 10 m depth to the surface the velocities of P- and S-waves decrease markedly to 3.0 km/sec and 1.5 km/sec, respectively. It is concluded that velocity anisotropy is due to ice crystal orientation, foliation structure of alternating ice layers, and crystallographic features. The greatest depth of ice in the Central Arm is about 1000 m, and both arms of the glacier are roughly parabolic in cross-section. (Gabriel-USGS)

STRUCTURE OF THE WATER BALANCE OF BODIES OF WATER,
Ministry of Melioration and Water Resources Management (USSR).
N. M. Kurganova.
Soviet Hydrol: Selec Pap, Issue No 2, p 150-153, 1968. 4 p, 1 fig, 2 tab, 3 ref.

Descriptors: *Water balance, *Hydrologic budget, *Reservoir design, *Statistical methods, Correlation analysis, Inflow, Evaporation, Streamflow, Precipitation (Atmospheric).
Identifiers: *USSR, Reservoir water balance.

Lake and reservoir water balances in the USSR are compared statistically. Surface area, catchment area, precipitation, inflow, evaporation, and outflow data are tabulated. The ratio of catchment area to water surface area is related to the effects of the elements of the water balance; as the ratio decreases, precipitation plays an increasing role and the evaporation role increases. The relations are shown by graphs and may be used in reservoir planning and design. (Knapp-USGS)

ABOUT THE PROBLEM OF THE DETERMINATION OF SHORT-PERIOD EVAPORATION AMOUNTS,
Meteorologischer Dienst der Deutschen Demokratischen Republic, Berlin. Forschungsinstitut fuer Hydrometeorologie.
D. Richter.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 293-299, 1968. 7 p, 4 fig, 1 tab, 6 ref.

Descriptors: *Evaporation, *Reservoir evaporation, Mathematical models, Evaporation pans, Water balance, Temperature, Hydrologic budget, Heat budget, Winds, Energy budget.
Identifiers: *Germany, Lake Stechlin (Germany).

Numerous recent investigations on the evaporation of free water surfaces yield remarkable improvement of the knowledge about this water budget parameter. At present monthly values may easily be assessed by several methods, accurate enough for operational requirements. However, a major problem is the determination of short-period evaporation. The basic theoretical concepts were obtained by recent studies of the exchange processes in the near-ground layer of air. The measuring technique is improved by the development of eddy flux evaporation measurements. In the present study the attempt was made to use theoretical formulas and measuring techniques to obtain diurnal and hourly values of the evaporation from a free water surface without employing empirical relations and constants. To test the theory, an investigation was made on Lake Stechlin, Germany with a wind-velocity gradient measuring unit, psychrometers, and water temperature thermometers. Calculated evaporation averages less than measured evaporation, and agreed well with data showing that evaporation-pan measurements are usually too high. (Knapp-USGS)

EVAPOTRANSPIRATION FROM TWO P LAND WATERSHEDS,
Forest Service (USDA), Grand Rapids, North Central Forest Experimental Station.
Roger R. Bay.
Symp on Geochem, Precipitation, Evapor Soil-Moisture, Hydrom, Proc Gen Assemb Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pu 78, p 300-307, 1968. 8 p, 1 fig, 4 tab, 14 ref.

Descriptors: *Evapotranspiration, *Bogs, nesota, Water balance, Energy budget, watersheds, Lakes, Humid climates, Runoff, fall-runoff relationships.
Identifiers: Thornthwaite method.

Measurements of precipitation runoff, and water table levels provided data for the calcul of evapotranspiration from 2 forested pea watersheds near Grand Rapids, Minnesota. tinuous hydrologic records were collected on perimental bog for 6 yr (1961-1966) and o other for the past 2 yr (1965-1966). Water changes in each bog were converted to in depth of storage by water yield coefficient specific peat horizons and used to adjust prec tion-runoff calculations. Evapotranspiration mates for the growing-season period May November 1 ranged from 87 to 121% of pot evapotranspiration computed by the Thornth method. Midsummer evapotranspiration (June 1 to Sept 1) were 70 to 99% of pot evapotranspiration. Mean daily evapotranspir values from both bogs during short summer d periods were consistently less than the calcu potential values. (Knapp-USGS)

2E. Streamflow and Runoff

STREAM LENGTHS AND BASIN AREA TOPOLOGICALLY RANDOM CHANNEL WORKS,
California Univ., Los Angeles.
Ronald L. Shreve
J Geol, Vol 77, No 4, p 397-414, July 1969. 16 fig, 2 tab, 20 ref.

Descriptors: *Geomorphology, *Drainage de *Drainage patterns (Geologic), *Stati methods, *Probability, Streams, Drainage sys Tributaries, Networks, Statistical models, M matical models.
Identifiers: Drainage basin topology, Stream Stream length, Topology.

topological properties of random channel net-
ks are examined to clarify the relationships of
am lengths, stream orders, and basin areas. In
te topologically random channel networks with
cified stream numbers, the expected number of
s per stream and per subnetwork of given order
given by closed but complicated formulas, from
ch the expected stream lengths and Schumm
gths can be calculated. As observed in natural
works, in a topologically random population,
the expected stream lengths do not satisfy Hor-
's geometric-series law as well as the expected
am numbers, whereas the expected Schumm
gths do, (2) on Horton diagrams the curves are
ightest for the most probable networks of order
er or higher, respectively, than the most proba-
and (3) the geometric-mean stream-length and
umm-length ratios are about 2 and 4.5, respec-
ly. The corresponding results for basin areas are
ctly the same as for Schumm lengths. In the
th Amboy basin studied by Schumm, the
rage area draining directly overland into unit
gth of channel is not a constant independent of
particular position of the channel in the basin as
proposed, but is less for exterior links than for
erior links. Substantial differences in the relative
as draining into sources and in other
morphic characteristics are not reflected in
rton diagrams because the Horton variables are
rages that are mainly determined by network
ology. Of most fundamental significance, there-
e, are not the Horton variables, but the more
mentary quantities, such as link lengths and
rce areas. (Knapp-USGS)

W69-08721

METHODS OF ESTIMATING MAXIMUM DISCHARGE OF GIVEN PROBABILITY,
Ministry of Melioration and Water Resources Management (USSR).
I. Ye. Kuksin.
Soviet Hydrol: Selec Pap, Issue No 2, p 157-160, 1968. 4 p, 2 tab, 8 ref.

Descriptors: *Flood forecasting, *Streamflow forecasting, *Statistical methods, Hydrograph analysis, Maximum probable flood, Probability, Frequency analysis, Estimating.
Identifiers: USSR, Gumbel method.

Methods are given for estimating the probabilities of given discharges from streamflow data. The most commonly used methods are interpretations of data plotted on various distribution curves. The gamma-distribution or binomial curve and the 3-parameter gamma distribution are commonly used in the USSR, and the log-normal curve, binomial curve, and the Fisher-Tippet curve are used elsewhere. Flood data from 3 gaging stations were used to test the methods of interpreting distribution curves. The most efficient method of estimating discharge probability, both theoretically and practically, was using the method of maximum likelihood and the binomial curve. The method of quantiles estimates maximum discharges better than the method of moments. The best estimates are by Gumbel's methods based on a theory of the extreme terms of a sample. (Knapp-USGS)

LIMITING MAXIMUM DISCHARGES IN LIT/SEC/SQ KM OF THE EARTH'S RIVERS AND THE METHODS FOR THEIR DETERMINATION (RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
D. L. Sokolovskiy.
Trudy Gos Gidrol Inst, No 163, p 3-8, 1968. 6 p, 1 tab, 9 ref.

Descriptors: *Discharge (Water), *Runoff, *Earth (Planet), *Rivers, Floods, Winter, Summer, Mathematical models, Meteorological data, Hydrologic data, Snowmelt, Statistical methods, Rain, Slopes, Heat balance.
Identifiers: Rain runoff.

Maximum rain runoff of the earth was investigated analytically and experimentally using maximal daily precipitation versus maximal rain runoff recorded in the USSR, Mediterranean Countries, North and South America, and Asia. A formula is proposed in which maximum elemental discharge is less than or equal to the product of water-supply intensity and empirical runoff, infiltration, and evapotranspiration coefficients. The maximum discharges computed by using the meteorological and hydrometrical data give similar values, in spite

of the errors involved in the recording of these data. (GabrielaUSGS)
W69-08736

REDUCTION OF A RIVER RUNOFF SERIES TO A LONG-TERM PERIOD BY USING A METHOD OF MULTILINEAR CORRELATION (RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
A. V. Rozhdestvenskiy, and A. G. Lobanova.
Trudy Gos Gidrol Inst, No 163, p 9-18, 1968. 10 p, 3 fig, 2 tab, 7 ref.

Descriptors: *Rivers, *Runoff, *Mathematical models, *Correlation analysis, Analog models, Hydrologic data, Gaging stations, Least squares method, Reliability, Electronic equipment.
Identifiers: *USSR, Svir', Neva, Vuoksa, Belaya, and Chusovaya Rivers.

The runoffs of Svir', Neva, Vuoksa, Belaya and Chusovaya Rivers were analyzed by using a method of multilinear correlation. The method is based on the numerical determination of the coefficients of regression expressed by a linear equation connecting the observed runoffs with those at the analogous points. The regression coefficients can be determined by using a technique developed by V. I. Romanovskiy (1938). The computed regression coefficients were applied to the long-term river discharge data. The reduction of a river runoff series to a long-term period, especially by using an electronic computer, can be considered as a dependable method. (Gabriel-USGS)

MATHEMATICAL MODELS FOR THE DISPERSION OF RADIONUCLIDES IN AQUATIC SYSTEMS,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
Neal E. Armstrong, and Earnest F. Gloyna.
Available from CFSTI as CONF 670503. Proc 2nd Nat Symp on Radioecology, CONF 675030, May 15-17, 1967, Ann Arbor, Mich, p 329-335, Mar 1969. 7 p, 4 fig, 23 ref.

Descriptors: *Dispersion, *Radioisotopes, *Surface waters, *Water pollution effects, *Mathematical models, Equations, Diffusion, Sorption, Hydraulic models.
Identifiers: Radioisotope dispersion.

A general equation is presented which describes radionuclide transport in terms of hydraulic dispersion and convection and by detention systems which sorb and release. A model describes sorption by various substrates using the concentration gradient between the equilibrium activity in the substrate and the actual activity. Linear equations allow an easy solution, while the non-linear form permits ready comparison of sorption mechanisms between systems. (See also Vol 2, No 18, 05C, W69-07441). (Knapp-USGS)
W69-08739

MEASUREMENTS OF BACKGROUND RADIATION IN AQUATIC HABITATS IN ALASKA,
Dartmouth Coll., Hanover, N. H. Dept of Biological Sciences; and Army Terrestrial Sciences Center, N.H.
G. E. Likens, and P. L. Johnson.
Available from CFSTI as CONF 670503. Proc 2nd Nat Symp on Radioecology Conf 670503, May 15-17, 1967, Ann Arbor, Mich, 319-328, Mar 1969. 10 p, 3 fig, 2 tab, 21 ref.

Descriptors: *Radioactivity, *Surface waters, *Alaska, *Background radiation, Lakes, Ponds, Streams, Sediments, Provenance, Radioecology, Arctic, Tundra.
Identifiers: Natural radioactivity.

Measurements of ionizing radiation, made during 1965 in 9 lakes, 3 rivers, 1 hot springs area and adjacent terrestrial substrates in Alaska, indicated that the background radiation in these habitats varied greatly. The lakes were characterized by a small amount of ionizing radiation at mid-depths and increasing quantities near the air and sediment boundaries. Moreover, the radioactivity of the sediments near shore was up to 3.2 times as high as the sediment values near the center. This pattern of background radiation has been relatively consistent in natural lakes of diverse geographic areas; hence, a model for background radiation in freshwater lakes is proposed. Variations in this model were a function of local differences in geologic substrates and input of allochthonous materials. The radioactivity from sediments in ponds of the Arctic tundra was due to naturally occurring radionuclides. (See also VOL 2, No 18, 05C, W69-07441). (Knapp-USGS)
W69-08740

WATER RESOURCES OF THE SCHUYLKILL RIVER BASIN,
Geological Survey, Harrisburg, Pa.
J. E. Biesecker, J. B. Lescinsky, and C. R. Wood.
Penn Dep Forests and Waters, Water Resources Bull No 3, May 1968. 198 p, 74 fig, 68 tab, 95 ref, 1 append.

Descriptors: *Water resources, *Water utilization, *Surface waters, *Groundwater, *Pennsylvania, Water quality, Water sources, Streamflow, Groundwater basins, Municipal water, Industrial water, Water levels, Water pollution, Acid mine water, Silting, Water pollution control, Sediment load, Data collections, Hydrologic data.
Identifiers: Schuylkill River (Penn), Philadelphia.

The water resources of the Schuylkill River Basin, Pennsylvania are evaluated by a comprehensive study of groundwater and surface water quantity, quality, and use. Special attention is given to the effects of coal mining, urbanization, and the effects of restoration and water pollution control of the Schuylkill River. In many parts of the basin, human activities are the most important hydrologic factor. Coal mining affects both groundwater and surface water quality in the headwaters and affects the quality of the entire main stem of the river. Reservoir regulation affects the flow of several tributaries. Philadelphia diverts up to 91% of the streamflow of the Schuylkill for public supply. Pumping is lowering groundwater levels in many areas. Mean annual runoff is 21.5 inches, or 48% of the annual precipitation of 44.7 inches. The population of the basin is 1.47 million, 91% served by public supply. The water problems of the basin result mainly from inadequate municipal water systems and degradation of sources by pollution. (Knapp-USGS)

WATER RESOURCES DATA FOR TEXAS, 1968-PART 1. SURFACE WATER RECORDS.
Geological Survey, Austin, Tex.

Geol Surv Basic Data Duplicated Rep, 1969. 591 p, 1 fig, index.

Descriptors: *Data collections, *Surface waters, *Streamflow, *Texas, Stream gages, Lakes, Reservoirs, Stage-discharge relations, Water supply.
Identifiers: *Surface water records, Water resources data.

The surface-water records for the 1968 water year for gaging stations, partial-record stations, and miscellaneous sites in Texas are presented. The data generally comprise a description of the station and a table showing the daily discharge and monthly and yearly discharge of the stream. The description of the station gives the location, drainage area, records available, type and hist
of gages, average discharge, extremes of dischar
and general remarks. The type of gage currentl
use and the datum of the gage above mean
level, and a condensed history of the types, lo
tions, and datums of previous gages used during
period of records available are listed. Informat
on the accuracy of the records and conditi
which affect the natural flow is given under '
marks.' Daily discharges, average discharge,
tremes, yearly totals, and peak discharges are lis
in table. (Knapp-USGS)
W69-08758

WATER RESOURCES DATA FOR NOR CAROLINA, 1968-PART 1. SURFACE WAT RECORDS.

*Streamflow, *Mathematical studies, Fourier a
ysis, Runoff, Discharge (Water), Highwater le
Correlation analysis, Floods, Low water mark

tifiers: *USSR, Shakh-Dara River, Tadz-stan.

harge data for 1947, 1948, and 1958 of the kh-Dara River Tadzhikistan, were analyzed by g the Fourier series with the mean monthly and ual river discharges expressed in cu m/sec. It assumed, on the basis of V. L. Shul'ts' in-igations of the Central Asia Rivers (1956), that coefficients of the Fourier series are a function he mean annual discharges and the hydrologic of Shakh-Dara can be quite satisfactorily ex-ssed by using the first 3 terms of the series. The edure of the harmonic analysis consists of the ulation of the mean annual discharge of given uency and then of the calculation of the Fouri-eries coefficients. By substituting the calculated meters into the Fourier series, the mean thly discharges can be readily evaluated. briel-USGS)

HNIQUE FOR LONG RANGE PREDICTION STREAM FLOW,
nson Univ., S.C.
ard M. Greening, and Albert G. Law.
nson Univ Water Resources Research Institute, t No 10, May 1969. 95 p, 6 tab, 18 fig, 28 ref, 3 end. OWRR Project A-010-SC.

criptors: Runoff, *Streamflow, Surface waters, er supply, *River forecasting, Hydrologic lels, *Streamflow forecasting.

problem of predicting streamflow for an ex-led period has received very little attention. work that has been done on this problem is lar-confined to the prediction of seasonal or an-flow volumes from snow melt by use of multi-correlation techniques. The period selected for liction was one month, since this is believed to n operationally useful time unit for potential s of the forecast product. The major factors af-ing the streamflow for the next month are be-d to be three in number. These are carry-over ow from antecedent groundwater flow and sur-runoff and runoff resulting from precipitation rring during the month to be forecast. A edure was devised to reflect each of these fac-. The river basin selected for testing the cast technique was the drainage area of the nee River near Greensboro, Georgia. The nique was developed using three years of ob-ed data and then tested using two years of inde-dent data. Median discharge and an adjusted ian discharge were used as a standard to test validity of the prediction technique. (Law-nson)

THE EFFECT OF MINGECHAUR RESERVOIR ON THE THERMAL REGIME OF THE LOWER REACHES OF KURA RIVER (RUSSIAN),
Akademiya Nauk SSSR.
R. B. Tarverdiyev.
Izv Akad Nauk, Azerbaidzh. SSR, No 1, p 49-55, 1969. 7 p, 6 fig, 3 tab, 2 ref.

Descriptors: *Reservoirs, *Thermal water, *Rivers, *River basins, *Water temperature, Seasonal, Winter, Hydroelectric plants, Autumn, Spring, Summer, Estuaries, Discharge (Water), Fish harvest, Irrigation efficiency.
Identifiers: Kura River, Transcaucasia, USSR.

The effect of the Mingechaur Reservoir on the thermal regime of the Kura River was investigated on the basis of temperature information collected at 14 stations on the river since 1930. Considerable change in water temperature has occurred since construction of the Mingechaur Reservoir. The change occurred during 2 periods: (1) autumn-winter period, characterized by a temperature increase of+6.0 deg at Mingechaur,+8.0 deg at Yevlakh,+3.5 deg at Zardob,+1.3 deg at Alibayramlov, and+1.1 deg in the estuary; and (2) spring-summer period characterized by a temperature decrease of -4.6 deg at Mingechaur, -5.8 deg at Yevlakh, -3.6 deg at Zardob, -1.4 deg at Alibayramlov, and -0.9 deg in the estuary. These changes in thermal regime of the Kura River may affect the fishing industry and irrigation possibilities. (Gabriel-USGS)

**SURFACE WATER DATA OF ONTARIO - 196
WATER YEAR.**
Department of Energy, Mines and Resources, O
tawa (Ontario). Inland Waters Branch.

Inland Waters Br Water Surv of Canada Basic Da
Rep, 1966. 277 p, 2 fig, index.

Descriptors: *Data collections, *Surface water
*Streamflow, Stream gages, Lakes Reservoir
Stage-discharge relations.
Identifiers: *Ontario, Canada, Surface wat
records, Water quality records, Water resource
data.

The surface-water records for the 1966 water ye
for gaging stations, partial-record stations, a
miscellaneous sites in Ontario are presented. Th
data generally comprise a description of the statio
and a table showing the daily discharge a
monthly and yearly discharge of the stream. Th
description of the station gives the locatio
drainage area, records available, type and histo
of gages, average discharge, extremes of discharg
and general remarks. The type of gage currently
use and the datum of the gage above mean se
level, and a condensed history of the types, loc
tions, and datums of previous gages used during th
period of records available are listed. Informatio
on the accuracy of the records and condition
which affect the natural flow is given under 'R
marks.' Daily discharges, average discharge, e
tremes, yearly totals, and peak discharges are liste
in a table. (Knapp-USGS)

ENERAL SUMMARY OF THE STATE OF EARCH ON GROUNDWATER HYDROLO-N DESERT ENVIRONMENTS,
na Univ., Tucson.
ne S. Simpson.
. McGinnies, B. J. Goldman, and Patricia re, Eds., Deserts of the World, an Appraisal search into their Physical and Biological En-ments, VIII, University of Arizona Press, Tuc-967. 18 p, 1 tab, 97 ref.

riptors: *Analog models, *Arid lands, undwater, *Evaluation, Hydrology, Aquifers, cial recharge management, Geohydrology, ogeology, Groundwater recharge, Water ta-Hydrologic budget, Water resources planning, arch and development, Water policy, Data ctions, Synthesis, Subsurface mapping, Water ge.

uthor presents a brief histroy of hydrology, an ation of the state of knowledge pertaining to ndwater in arid environs, and recommenda-on future research needs of sound water pol-rmation. Sources, accessibility, and reliability rtinent information are treated. The interrela-hip of the objectives of research to those of policy is stressed as is the need for systematic gement of groundwater resources (eg. Israel). vledge on aquifers, water budget, and aquifer rge in arid lands is evaluated in relation to the ms-analysis approach toward solution of water gement problems. The author concludes that ndwater hydrology 'is on the threshold of an rtant period of integration' and it is now sary and possible to synthesize, to exhibit the ioning system as a whole. Recommendations ture research needs in arid regions include nplementation of rational data collection pro-s in response to modern computer technology, ata on hydrogeologic mapping, basic relations en water chemistry and aquifer properties, mination of the distribution of hydraulic head ce and time (suggests development of auto-one year recording gage), (3) evaluation of ial recharge, this requires a probabilistic iption of stream flow for arid regions, (4) r funding. Includes large annotated bibliog-. (Sherbrooke-Ariz)

SURING UNDERGROUND-EXPLOSION CTS ON WATER LEVELS IN SURROUND-AQUIFERS,
gical Survey, Denver, Colo.
Garber, and L. E. Wollitz.
nd Water, Vol 7, No 4, p 3-7, July-Aug 1969. fig, 6 ref.

iptors: *Water levels, *Groundwater, *Water *Nuclear explosions, *Water level fluctua-Measurement, Seismic waves, Aquifers, la.
fiers: *Nuclear explosion effects.

Underground detonations may produce observable effects in surrounding aquifers and wells. The nature and the duration of the effect at any observation point seem to depend on several factors such as the amount of energy released by the detonation, the geologic environment, the position of the buried explosive device in relation to the saturated zone, aquifer characteristics, and the distance from point of detonation. Precise measurement of these effects in wells presented numerous technical problems and resulted in the development of specialized techniques. Initially, these effects were observed by measuring the fluctuation of the free water surface in wells. The current technique employs high-resolution pressure transducers deep in the water column. Pneumatic packers may be used to restrict the movement of water into the well. Data are recorded on high-speed oscillographs. (Knapp-USGS)

FIELD USE OF ORIFICE METERS,
Geological Survey, Huron, S. Dak.
Donald G. Jorgensen.
Ground Water, Vol 7, No 4, p 8-11, July-Aug 1969. 4 p, 6 fig, 4 ref.

Descriptors: *Discharge (Water), *Measurement, *Flow measurement, *Orifices, Water wells, Discharge measurement, Flow rates, Orifice flow, Outlets, Pipes.
Identifiers: Pump discharge measurement.

A well-designed and calibrated orifice meter is an accurate and inexpensive measuring device for flow. Endline orifices can be calibrated at work sites by solving an equation that interrelates easily measured dimensions of the orifice and outflow. This paper summarizes the development of the discharge equation for circular orifices and describes a procedure for determining the coefficient of discharge under field conditions. (Knapp-USGS)

VARIATIONS IN FILTRATION VELOCITY DUE TO RANDOM LARGE-SCALE FLUCTUATIONS OF POROSITY,
Moscow Inst. of Mechanical Problems (USSR).
Yu A. Buyevich, A. I. Leonov, and V. M. Safrai.
J Fluid Mech, Vol 37, Part 2, p 371-381, June 23, 1969. 11 p, 12 ref.

Descriptors: *Filtration, *Flow, *Porous media, *Groundwater movement, Porosity, Permeability, Mathematical studies, Turbulence, Laminar flow, Turbulent flow, Unsteady flow, Saturated flow, Diffusion.
Identifiers: Porosity variation, Porosity inhomogeneity.

The local porosity of a real porous material, obtained by averaging over volumes containing a sufficiently large number of pores, is different from the mean porosity of the material as a whole. This difference is caused by large-scale defects of the porous structure and can be treated as a random function of position in the porous material. Such a random deviation of the local porosity from the average value causes random local flows superimposed upon the mean filtration flow. The characteristic scale of such motion is much larger than that of the flow of a fluid through individual pores. The phenomenon appears to play an important role in transport processes in filtranion. The statistical characteristics of the random fields under consideration are determined on the basis of the assumption that the local porosity is a random function of position with independent increments. Expressions for correlati wns of various quantities are obtained in terms of the characteristics of porosity fluctu wtions, and the effective coefficients of diffusion caused by the random motions under study are estimated. GROUND WATER HYDROLOGY FOR WATER WELL DRILLING CONTRACTORS,
Kent State Univ., Ohio. Dept. of Geology.
Jon L. Rau.
Kent State Univ Dep Geol Textbook Rep, 1968. 259 p, 514 ref.

Descriptors: *Groundwater, *Hydrogeology, *Water wells, Maps, Cross-sections, Stratigraphy, Aquifers, Structural geology, Hydrologic cycle, Artesian wells, Recharge, Water quality, Electrical studies, Surveys, United States.
Identifiers: *Groundwater prospecting, *Textbooks, Aquifer testing.

A textbook for water well drilling contractors presents the basic geologic factors controlling the occurrence, availability, and quality of groundwater. Groundwater hydraulics is not discussed in detail, but important references to it are listed. The hydrogeology of the Eastern United States is covered in better detail than that of other parts of the country. Some of the topics covered in detail are topographic maps, rock terminology, stratigraphic correlation, geomorphology, geologic maps, geologic structure, structural maps, cross sections, the hydrologic cycle, occurrence of groundwater, properties of aquifers, artesian water, induced infiltration, aquifer testing, recharge, groundwater prospecting, well logging, resistivity surveys, water quality, and groundwater in the eastern U.S. physiographic provinces. A LITERATURE SURVEY OF THE USE OF RADIOISOTOPES IN GROUND-WATER STUDIES,
Institute of Geological Sciences, London (England).
J. D. Mather.
Great Brit Inst Geol Sci Tech Commun No 1, 1968. 27 p, 1 fig, 1 tab, 121 ref.

Descriptors: *Groundwater, *Aquifers, *Radioisotopes, Water supply, Radioactive dating, Tritium, Carbon, Silica, Tracers, Porosity, Velocity, Rainfall, Strontium radioisotopes,

Seasonal, Plant physiology, Analytical techniques, Wells.
Identifiers: Radioisotopes in groundwater study.

A detailed survey is presented of the literature on radioactive dating of groundwater. Topics discussed include radioactive dating (tritium, carbon-14, and silicon-32), and radioisotopes as groundwater tracers. Preliminary tracer evaluations are made and field studies described. (Gabriel-USGS)
W69-08745

CAUSES OF FLUCTUATIONS IN THE RATE OF DISCHARGE OF CLEAR LAKE SPRINGS, MILLARD COUNTY, UTAH,
Geological Survey, Washington, D.C.
R. W. Mower.
Geol Surv Water-Supply Pap 1839-E, 1967. 31 p, 8 fig, 1 plate, 2 tab, 12 ref.

Descriptors: *Springs, *Discharge (Water), *Fluctuation, *Utah, Surface-groundwater relationships, Precipitation (Atmospheric), Basalts, Alluvium, Hydrogeology, Groundwater movement, Irrigation wells.
Identifiers: *Pavant Valley, Artesian aquifer.

To determine the relation of the rate of flow of Clear Lake Springs to weather conditions during 1959-1964 and to groundwater withdrawals in Pavant Valley, a hydrologic study was made of the spring area, Millard County, Utah. It was found that seasonal fluctuations in discharge rate of Clear Lake Springs are caused both by variations in the rate of groundwater recharge and by the related variations in the rate of pumping for irrigation in Pavant Valley. Withdrawal of groundwater from wells in the southern four districts causes seasonal reductions in the flow of the springs by reducing the hydraulic gradient between the wells and the springs. Average annual volume of spring discharge was 14,900 acre ft in 1960-1964. Water enters the very permeable basalt aquifer as direct recharge from precipitation, as interformational leakage from a contiguous artesian aquifer in lake and alluvial sediments, and as infiltration of infrequent flood runoff and of unconsumed irrigation water in the valley lowlands. A hydrograph of the spring flow and other data indicate that about 1/5 of the discharged water is from precipitation on the basalt outcrop of the aquifer. (Llaverias-USGS)

EFFECTS OF LARGE-SCALE MINING WITHDRAWALS OF GROUND WATER,
North Carolina State Dept. of Water and Air Resources, Raleigh. Div. of Ground Water.
Harry M. Peek.
Ground Water, Vol 7, No 4, p 12-20, July-Aug 1969. 9 p, 8 fig, 7 ref.

Descriptors: *Water levels, *Groundwater, *Mine drainage, *Saline water intrusion, *Aquifers, North Carolina, Water level fluctuations, Artesian wells, Hydrogeology, Recharge, Groundwater movement, Water management (Applied).
Identifiers: Cone of depression.

Expanding water requirements during recent years have intensified development of the productive sedimentary aquifers of the North Carolina Coastal Plain. The effects of this development emphasize the need for an effective management program. Withdrawal of about 60 mgd from the Castle Hayne limestone, the most productive artesian aquifer of the area, began in July 1965 at a phosphate mine adjacent to the Pamlico River in Beaufort County. Within a few months, the artesian head was lowered below sea level in an area of about 800 sq mi, and to more than 100 ft below sea level in the immediate vicinity of pumping. Under these conditions the aquifer became vulnerable to encroachment of saline water from (1) areas of natural occurrence of brackish water in the limestone member of the aquifer; (2) leakage of brackish surface water through the confining beds; and (3) vertical movement of brackish water from the underlying sand member of the aquifer. The dramatic effects of the large withdrawals and the threat of damage to the aquifer created sufficient public concern so that legislation was passed giving the Board of Water and Air Resources authority to regulate groundwater withdrawals as needed. An adequate management program can be accomplished that will not only protect the aquifer but will improve the development potential. The development of such a management program requires a thorough knowledge of the hydrology of the aquifer system, the objective of studies in progress. The implementation of the program will require the support of an informed public. (Knapp-USGS)

THE APPLICATION OF GEOELECTRICAL METHODS TO GROUND-WATER EXPLORATION OF UNCONSOLIDATED METHODS TO GROUND-WATER EXPLORATION OF UNCONSOLIDATED FORMATIONS IN SEMI-ARID AREAS,
Z. Krulc, and M. Mladenovic.
Geoexploration, Vol 7, No 2, p 83-95, June 196
13 p, 8 fig, 34 ref.

Descriptors: *Groundwater, *Aquifers, *Electric studies, *Semiarid climates, Hydrologic properti Electrical properties, Hydrogeology, Soil physic properties, Structural geology, Salinity, Resistivit Boreholes, Geology, Alluvium, Limestones, Marl
Identifiers: *United Arabic Republic (Egypt) a Libya.

The application and interpretation are described geoelectrical methods utilized in the semiarid are of Egypt and Libya in exploration for water-bearı formations characterized by their poor consolid tion. Geoelectrical methods can be successfully a plied in semiarid regions for the solution of seve problems as follows: (1) the penetration of sali water into the dry land; (2) the separation of fre water lenses floating on saline water; (3) t establishment of the depth of water--impermeab basement; and (4) other pertinent problems. The problems can be often successfully solved by t use of resistivity techniques--geoelectrical soun ing and geoelectrical profiling. In the geoelectric sounding method a hydrogeological section is o tained at the observation points as well as the da concerning the depth of single horizons. If explor tion boreholes are available, the interpretation geoelectrical investigations becomes easier, mo accurate, and more reliable. (Gabriel-USGS)

WATER CHARACTERISTICS FROM SPRINGS IN THE LIMESTONE REGION OF CROATIA,
Institute of Sanitary Engineering, Zagreb (Yugoslavia).
Milivoj Petrik.
Hydrol of fractured rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, p 624-634, 1967. 11 p, 4 fig, 41 ref.

Descriptors: *Springs, *Spring water, *Limestones, Geochemistry, Carbon dioxide, Calcium, Magnesium, Chloride, Sulfates, Water temperature, Alkaline water, Aquifers, Hardness (Water), Dolomite, Karst, Geology, Mesozoic era, Tertiary period, Rivers.
Identifiers: *Yugoslavia, Croatia, Spring water characteristics.

Water from 100 springs located throughout the limestone region of Croatia was analyzed and the analytical results and other data are presented. Determinations were made of free carbon dioxide, dissolved oxygen, carbonate and non-carbonate hardness, alkalinity, magnesium, calcium, and chloride contents. Temperature of the spring waters varied between 4.8 and 18.0 deg C. Altitude of the springs sampled ranges from sea level to about 1000 m above sea level. Results of the study were summarized for smaller sub-regions and some general sub-regional and regional characteristics were indicated. A comparison was made between the underground water of this region and water localized in the finely-grained aquifers of non-karstic parts of Croatia. Some of the characteristics of waters from four rivers are given. (Gabriel-USGS)

Identifiers: *Yugoslavia.

This paper discusses the effect of geological and other factors, such as the processes of leaching and infiltration, on the hydrochemical characteristics of groundwater. The origin of particular types of groundwater is also presented. The chemical composition of sodium hydrocarbonate type of waters depends on the original composition of waters subjected to desulfatization and on the chemical composition of rocks subjected to leaching. Factors that affect the composition of ground waters are: the original composition, rock porosity, rock composition, the presence of NaCl as a result of the 'struggle' between marine and continental environments, and the physiochemical laws operating in the processes of accumulation and movement of groundwaters. Diagrams and profiles illustrate the basic hydrochemical characteristics and a classification of the groundwater is given. (Gabriel-USGS)

SOLUBILITY RELATIONSHIP OF LIMESTONES AND DOLOMITES (FRENCH),
Institute for Geological and Geophysical Research, Belgrade (Yugoslavia).
Dragoljub Zogovic.
Hydrol of fractured rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, p 615-623, 1967. 9 p, 3 fig, 5 tab, 9 ref.

Descriptors: *Solubility, *Limestones, *Dolomite, Natural flow, Karst, Aquifers, Carbonate rocks, Physicochemical properties, Crystalline rocks, Crystallization, Hydrogeology, Thermodynamic behaviour, Sulfates, Anhydrite, Calcite, Gypsum, Acidic waters.
Identifiers: *Solubility relationship, Hydrochemical properties.

The solubility of limestones and dolomites, as the main factor in forming karstic areas, is critically reviewed on the basis of earlier investigations by Lehman (1932, Leipzig and Wien), Leitmeier (1916, Stuttgart), Ogiljvi (1956, Moscow), Sokolov (1962, Moscow) and others. It is concluded that rock solubility depends mainly on the nature of crystal material where the energy of crystal lattice is of primary importance. The structure of calcareous rocks, the presence of various impurities and the character of a solvent strongly affect the solubility process. The degree of solubility of limestone and dolomite rocks depends on the hydrochemical and thermodynamic properties of aqueous solutions present in the karstic areas. (Gabriel-USGS)

TRACER DYNAMICS IN LAMINAR FLOW THROUGH POROUS MEDIA (ROMANIAN),
Academia R. P. R., Bucharest. Institutul de Fizica Atomica.
Emilian Gaspar.
Hidrotehnica, Gosp Apelor, Meteorol, Vol 13, No 6, p 298-303, June 1968. 6 p, 5 fig, 3 tab, 19 ref.

Descriptors: *Tracers, *Radioisotopes, *Laminar flow, *Porous media, Analytical techniques, Tracking techniques, Radioactive dating, Rock properties, Adsorption, Absorption, Permeability, Ion exchange.
Identifiers: *Tracer dynamics, Groundwater reservoir.

The paper discusses the use of tracer methods to solve hydrological problems. The dynamics of stable or radioactive tracers in groundwater is a very complicated process which cannot be entirely predicted. Laboratory experiments indicated that the concentration of radioactive tracers is a function of percolation time, length of soil column, average velocity, and longitudinal dispersion constants. The chemical, physical, and hydrological aspects of tracer and water movement through porous media should be known to evaluate the usefulness of tracer techniques in hydrology. The tracer can be retained by various geologic formations by adsorption, absorption, and ion exchange phenomena.

Tracer solubility in water, density, viscosity, and surface tension of tracer solution as well as the porosity and permeability of percolating media control to a large extent the movement of radioactive tracers in aquifer formations. Thermal and pressure variations within the water-bearing formations play an important role on hydrodynamic phenomena. There is a recognized need for basic research dealing with the use of radioisotopes in order to solve important hydrologic problems. (Carstea-USGS)

RECORDS OF WELLS AND SPRINGS, SAN ANTONIO AREA, TEXAS,
Geological Survey, Washington, D.C.
Paul Rettman.
Texas Water Develop Board-Edwards Underground Water Dist Rep, May 1969. 28 p, 6 fig, 1 tab, 7 ref.

Descriptors: *Water wells, *Springs, *Data collections, *Texas, Aquifers, Limestones, Water yield, Water levels, Water utilization.
Identifiers: Well data collections, *San Antonio (Tex), Edwards Limestone.

Records of wells and springs in the San Antonio area, Texas are tabulated. Most of the wells produce water from the Edwards and associated limestones. Each record consists of well number, owner's name, date completed, depth, diameter, depth to openings, length open to aquifer, finish, logs available, aquifers, land surface, altitude, depth to water, data of measurement, use of water, use of well, type of lift, power, and yield. Maps show well and spring locations. (Knapp-USGS)

GROUND WATERS AND SURFACE WATERS OF THE BURIAT-MONGOLIAN A.S.S.R. AS A SOURCE OF AGRICULTURAL WATER SUPPLY (RUSSIAN),
G. V. Kopanev.
Izdatel'stvo Akad Nauk, SSSR, Moscow, 1960. 152 p, 24 fig, 11 tab, 80 ref.

Descriptors: *Agriculture, *Runoff, *Aquifers, Topography, Climates, River basins, Hydrologic data, Gaging stations, Hydrogeology, Mineral water, Water supply, Water utilization, Geology, Pollutants, Water chemistry, Water analysis, Water structure.
Identifiers: *USSR, Buriat, A.S.S.R. water resources.

Agricultural water supply in the Buriat-Mongolian A.S.S.R. was investigated on the basis of several earlier publications. The report describes general physical geography of the region and several chapters are devoted to the geohydrological conditions and agricultural potential. Surface water and groundwater relationships, runoff characteristics, and climate are discussed. The geology, groundwater types, regimes, and water quality are described. River systems, runoff distribution (both annually and periodically), and irrigation for pasture and other crops are discussed. (Gabriel-USGS)

THE EFFECTS OF TEMPERATURE AND DENSITY GRADIENTS UPON THE MOVEMENT OF CONTAMINANTS IN SATURATED AQUIFERS,
Alabama Univ., University. Dept. of Engineering Mechanics.
Harold R. Henry.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 54-65, 1968. 12 p, 4 fig, 26 ref.

Descriptors: *Saturated flow, *Diffusion, *Dispersion, *Convection, *Groundwater movement, Solutes, Wastes, Path of pollutants, Mathematical models, Currents (Water), Mass transfer, Aquifers.
Identifiers: Thermal gradients.

The effects of gradients in temperature and density on the movement of contaminants in groundwater were studied by imposing a horizontal lateral temperature gradient on a tube of square cross section containing water-saturated sand. A convection current increased in strength as the temperature gradient increased. The effective value of thermal diffusivity was about 50 times larger than the expected value because of dispersion caused by the movement of water through tortuously interconnected interstices of the sand. (Knapp-USGS)

HEAT CONDUCTIVITY OF WATER-BEARING SATURATED ROCKS AS A FUNCTION OF PRESSURE, TEMPERATURE, AND ROCK COMPOSITION (RUSSIAN),
Akademiya Nauk SSSR
E. M. Bayramov, and A. B. Tsaturyants.
Izv Akad Nauk, Azerbaidzh. SSR, No 1, p 25-29, 1969. 5 p, 5 fig, 4 ref

Descriptors: *Aquifers, *Groundwater, *Saturation, *Pressure, *Water temperature, *Rock properties, Geology, Exploitation, Air temperature, Porosity, Oil reservoirs, Moisture, Moisture content, Sampling, Clays, Sands, Bore holes.
Identifiers: USSR.

Heat conductivity of water-bearing and oil-bearing sedimentary rocks was experimentally investigated by using several combinations of clay and sand at various temperatures and pressures. Experimental arrangement and technique used was in accordance with a method developed by A. K. Abaszade, A. A. Gylmanov, and E. M. Bayramov (1965), with temperatures and pressures up to 80 deg C and 1,500 atm, respectively. Five graphs of heat conductivity versus pressure and rock composition, based on the experimental data, are given in the article. (Gabriel-USGS)

MONSOON OVER THE INDUS VALLEY DURING THE HARAPPAN PERIOD,
Council of Scientific and Industrial Research, New Delhi (India).
C. Ramaswamy.
Nature, Vol 217, No 5129, p 628-629, Feb 17, 1968. 2 p, 1 fig, 12 ref.

Descriptors: *Paleohydrology, *Paleoclimatology, *Monsoons, Groundwater, History, Quarternary period, Radioactive dating, Precipitation (Atmospheric).
Identifiers: *India, *Indus Valley, Harappan period.

Archaeological and hydrogeological studies show that the climate in the Indus Valley in the Harappan period (2500-1700 BC) was much wetter than the present climate. Detailed study of the 500, 300, and 200 harts suggests that quasi-stationary troughs occasionally extended into the area and induce monsoon activity. In the Harappan period such troughs must have extend more frequently into the Indus Valley than at present. Recent discovery of considerable groundwater reserves supports this idea. The C-14 age of the water is about 5,000 yr BP. (Knapp-USGS)

SINUOSITY IN LIMESTONE SOLUTION C DUITS,
Pennsylvania State Univ., University Park. Dep Geology and Geophysics; Pennsylvania State U University Park. Materials Research Lab.; Pennsylvania State Univ., University Park. Dep Geochemistry and Mineralogy.
George H. Deike, and William B. White.
Amer J Sci, Vol 267, No 2, p 230-241, Feb 19 12 p, 5 fig, 2 tab, 23 ref.

Descriptors: *Channel morphology, *K *Caves, *Missouri, *Kentucky. Closed con flow, Drainage, Limestones, Underground, Stre flow, Meanders.
Identifiers: Cave sinuosity, European caves.

Cave passages are regarded as segments drainage conduits, and those with sinuous patt are compared with the meander belts of surf streams. Caves were sampled from central K tucky, Missouri, and various Appalachian and ropean reports. Caves that exhibited para uniform walls which did not branch in the m sured reach were selected. Two types of m linearity were found: an angulate form genera by water flow down a hydraulic gradient diago to a rectangular joint set and a curvilinear fo with sweeping S-bends apparently related to me ders in surface streams. The average bend spac and channel width of the sinuous form are rela by a power function. The constants are simila those proposed for alluvial rivers. (Knapp-USGS

WATER REPELLENT SOILS AND THEIR RELATION TO WILDFIRE TEMPERATURES,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
L. F. DeBano, and J. S. Krammes.
Bulletin of the I.A.S.H., XI Annee No 2, p 14-19, 1966.

Descriptors: *Waterproofing, *Soil temperature, *Burning, *Wettability, Infiltration, Soil erosion, Heat treatment, Soils, Watershed management, Overland flow, Heat transfer, Thermal conductivity.
Identifiers: Water repellent soils, Wildfires, *Non-wettable soils.

A naturally occurring water resistant soil was exposed to different burning times and temperatures after which the soil samples were tested for non-wettability. The less intense treatments produced an extremely non-wettable condition. Temperatures of 800 and 900 degrees applied for 20 minutes completely destroyed the non-wettable property. Heat treatments within the realm of soil temperatures existing during wildfires were capable of producing the extreme non-wettable condition. The increased surface runoff and erosion from burned southern California watersheds could be the result of this relationship. (DeBano)

FORMATION OF NON-WETTABLE SOILS...INVOLVES HEAT TRANSFER MECHANISM,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Leonard F. DeBano.
US Forest Serv Res Note PSW-132, 1966. 8 p.

Descriptors: *Heat transfer, *Heat treatment, *Condensation, *Wettability, Waterproofing, Soil erosion, Burning, Soil temperature, Shrubs, Chaparral, Sands, Laboratory tests.
Identifiers: Hydrophobic substances, Vaporization and condensation.

After a wildfire, some brushland soils in southern California have been found to include a non-wettable layer. This formation may be the result of hydrophobic material volatilizing and later condensing. In burning experiments, hydrophobic substances from ceanothus litter and non-wettable soil were moved downward into an underlying wettable sand by temperature gradients. The wettable sand acquired a marked resistance to wetting after the burning treatment. (Author)

SOIL WETTABILITY AND WETTING AGENTS...OUR CURRENT KNOWLEDGE OF THE PROBLEM,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Leonard F. DeBano, Joseph F. Osborn, Jay S. Krammes, and John Letey, Jr.
US Forest Serv Res Paper PSW-43, 1967. 13 p.

Descriptors: *Soils, *Wettability, *Surfactants, *Soil erosion, Burning, Waterproofing, Wetting, Grasses, Soil temperatures, Vegetation establishment, Heat transfer, Overland flow, Evaporation, Infiltration, Chaparral, Watershed management.
Identifiers: Hydrophobic substances, Wildfires, *Non-wettable soils.

Soils that resist wetting are a widespread phenomenon on chaparral areas of southern California watersheds. On burned watersheds, non-wettable soils markedly reduce moisture movement during both evaporation and infiltration. The reduced infiltration rate probably contributes significantly to the high debris production from the watersheds. Factors involved in the formation of non-wettable soils include vegetation and soil temperatures during fire. Wetting agents applied to burned areas apparently help retard debris movement and enhance vegetation establishment. (Authors)

SEED GERMINATION AND ESTABLISHMENT AS AFFECTED BY NON-WETTABLE SOILS AND WETTING AGENTS,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station; and California Univ., Riverside.
J. Osborn, J. Letey, L. F. DeBano, and Earl Terry.
Ecology, Vol 48, No 3, p 494-497, 1967.

Descriptors: *Germination, *Surfactants, *Vegetation establishment, *Wettability, Waterproofing, Grasses, Wetting, Seeds, Infiltration, Soil moisture, Slopes, Laboratory tests, Overland flow, Soils.
Identifiers: *Non-wettable soils, Seed germination, Annual ryegrass.

To study the effects of soil wettability and wetting agents on seed germination and establishment, three substrates (naturally occurring non-wettable soil, wettable soil, and a wettable quartz sand) were placed in small plastic containers and received applications of wetting agent in liquid, wetting agent on perlite, and no treatment as a control. The containers were seeded to wimmera ryegrass and were placed both on a 30 deg slope and on the level in a controlled temperature chamber (70 deg F). Seed placed on non-wettable soil which received no wetting agent treatment failed to germinate in those containers placed on the slope. Good germination occurred on soil which was treated with a wetting agent and on wettable sand. The same relationships occurred for the plants which were allowed to become established. Differences are primarily due to water relations; water ran off the sloping non-wettable soils. Wetting agent treatment on the wettable sand reduced both germination and establishment of the tested plants. (DeBano)

THE TESTING OF A METHOD FOR PREDICTING WATER INTAKE INTO SOILS BY THE USE OF FIELD CORES,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
Royce L. Lambert.
Doctor of Philosophy Thesis. Department of Agronomy, Purdue University. 100 p, 27 fig, 10 tab, 64 ref, 1 append. OWRR Proj No A-010-IND.

Descriptors: *Infiltration, Hydraulic, Conductivity, Infiltrometer, *Soil physical properties, Soil structure, Soil texture, Soil types, *Soil water, Vegetative effects, Approximation methods.
Identifiers: Green-Ampt Equation.

An approximate theory method for predicting infiltration based on the Green-Ampt equation was tested as to its applicability for use in the field. Field cores were taken into the laboratory and evaluated as to their water intake rates and then these values related to the parameters from the approximate theory equation. The infiltration rates as calculated by the approximate theory method were then related to those rates determined in the field by a sprinkling infiltrometer. The findings were that although the infiltration rates determined by the approximate theory method and those in the field were relatively similar, the values for the parameters involved in the equation were such they did not have any physical significance. This deviation was attributed to the wide variance in the physical structure of the soil in the field cores. (Wiersma-Purdue)

GEOLOGICAL CONDITIONS FOR THE FORMATION OF PEAT-BOGS OF THE CENTRAL PART OF WESTERN SIBERIA (RUSSIAN),
Moscow State Univ. (USSR). Dept. of Soil Science and Engineering Geology.
A. I. Sergeyev.
Vestnik Moskov Univ Nauch Zh, Ser 4, No 2, Geol, p 95-100, Mar-Apr 1969. 6 p, 2 fig, 2 tab, 5 ref.

Descriptors: *Geology, *Peat, *Bogs, Geomorphology, River basins, Flood plains, Clays, Sands, Lignite, Climates, Organic matter, Temperature, Chemical analysis, Sediments, Hydrologic properties, Forests, Salinity, Calcium, Carbonates, Lakes.
Identifiers: *USSR, Western Siberia, Peat bogs.

Geology and chemical composition of peat and peat waters of Western Siberia were investigated for the purpose of understanding the processes of their formation. The study of marsh-water indicates a gradual increase in pH and mineralization content from upper layers to the lower peat layers. Peat in the upper layers is formed under the prevailing acid conditions, whereas the lower peat layers are formed in the akaline or weakly-acidic media. Favorable climatic conditions, weak relief, and the presence of certain bedrocks can be considered as the main factors influencing the development of peat-bogs in Western Siberia. (Gabriel-USGS)

THE EFFECT OF THE CONCENTRATION AND MOVEMENT OF SOLUTIONS ON THE SWELLING, DISPERSION, AND MOVEMENT OF CLAY IN SALINE AND ALKALI SOILS,
Reading Univ. (England). Dept. of Soil Science.
D. L. Rowell, D. Payne, and N. Ahmad.
J Soil Sci, Vol 20, No 1, p 176-188, Mar 1969. 13 p, 6 fig, 14 ref.

Descriptors: *Expansive soils, *Ion exchange, *Water chemistry, *Alkaline soils, *Saline soils, Permeability, Hydraulic conductivity, Expansive clays, Impervious soils, Electrolytes, Montmorillonite, Adsorption, Laboratory tests, Soil mechanics, Dispersion, Diffusion.
Identifiers: Swelling clays, Swelling soils.

Changes in permeability of a soil containing montmorillonite, and the swelling of orientated aggregates of extracted clay have been found and compared with the concentrations at which aggregates dispersed in stationary solutions, and the concentrations at which soil suspensions dispersed when shaken. The results indicate that: (a) permeability begins to decrease at the same concentrations as the clay begins to swell, (b) the changes in permeability are directly controlled by the swelling of clay until clay dispersion and movement begins, (c) the concentration at which clay disperses depends on the mechanical stress applied, (d) when small mechanical stresses are applied, the proportion of the clay which swells and disperses depends directly on the exchangeable sodium percentage, and (e) large mechanical stresses may disperse most of the clay even at low exchangeable sodium percentages. (Knapp-USGS)
W69-08755

THE CONSTRUCTION OF CALIBRATION CURVES FOR DETERMINING WATER CONTENT FROM RADIATION COUNTS,
East Malling Research Station, Maidstone (England).
D. A. Holland.
J Soil Sci, Vol 20, No 1, p 132-140, Mar 1969. 9 p, 2 fig, 22 ref.

Descriptors: *Nuclear moisture meters, *Calibrations, *Statistical methods, Instrumentation, Measurement, Regression analysis, Soil moisture, Moisture content, Soil moisture meters, Radiation.
Identifiers: Nuclear soil moisture meters, Calibration curves.

The application of regression theory to the construction of calibration curves for the estimation of water content from an observed radiation count is possible only when the relationship between count and water content is linear, a homogeneous error applies to the dependent variate, count, whatever its value, and the independent variate, water content, is determined free of error. Determination of the errors of estimation is further complicated by the necessity to fit the regression of count, as the dependent variate, on water content and then to invert the equation in order to estimate moisture content from count. It is shown that these requirements can be fulfilled by an initial transformation of the data and by repeated subsampling for the determination of water content. A method is given for calculating errors of estimation. Experimentally, it was found that a transformation (logarithmic) was necessary when calibrating a beta-gage for leaf moisture measurement. When calibrating a neutron probe for soil-moisture measurement no transformation was required, but it was necessary to take repeated subsamples for water content determinations. (Knapp-USGS)
W69-08756

INFLUENCE OF TEXTURE ON THE MOISTURE CHARACTERISTICS OF SOIL: RELATIONSHIPS BETWEEN PARTICLE-SIZE COMPOSITION AND MOISTURE CONTENTS AT UPPER AND LOWER LIMITS OF AVAILABLE-WATER,
National Vegetable Research Station, Wellesbourne (England).
P. J. Salter, and J. B. Williams.
J Soil Sci, Vol 20, No 1, p 126-131, Mar 1969. 6 p, 2 tab, 8 ref.

Descriptors: *Moisture content, *Soil moisture, *Soil texture, Soil physical properties, Soil chemical properties, Regression analysis, Particle size, Porosity, Permeability, Organic matter, Soil classifications, Equations.
Identifiers: *Soil moisture-texture relationships.

A quantitative assessment was made of the effect of the proportion of sand, silt, clay, and organic matter in 26 soils on the moisture contents at the upper and lower limits of available-water of the soils. Regression equations were obtained which enabled the moisture contents to be estimated on a weight or volume basis from mechanical analysis data using either International or American size grades. The accuracy of estimating the upper limit of available-water from the various equations ranged from 9 to 22% for the lower limit, from 8 to 16% of the measured values. Mean values of the moisture contents at the upper and lower limits of available-water for each textural class were calculated from the average particle-size composition for each class and from the regressions obtained. (Knapp-USGS)
W69-08757

THE EFFECT OF HYSTERESIS OF PORE-WATER ON THE HYDRAULIC CONDUCTIVITY,
Agricultural Coll. of Athens (Greece). Dept. of Agricultural Chemistry.
A. Poulovassilis.
J Soil Sci, Vol 20, No 1, p 52-56, Mar 1969. 5 p, 2 fig, 16 ref.

Descriptors: *Soil water movement, *Hysteresis, *Hydraulic conductivity, Wetting, Water yield, Drying, Specific retention, Specific yield, Moisture content.
Identifiers: Hysteresis--hydraulic conductivity, Pore water.

It is pointed out with the help of the Independent Domain Theory that a fraction of pore-water is contained in pores not common to both the wetting and drying states and that this volume in a wetting state is contained in pores whose draining radii are greater than those of the pores in the drying state. It is suggested that hysteresis may affect the hydraulic conductivity through differences of the radii of the pores which tend to endow a wetting state with a conductivity greater than that of an equally wet but drying state; secondly, through differences of the coordinates of the above-mentioned pores, which may influence the paths of flow and consequently the hydraulic conductivity, and will have either a similar or opposite effect. It is concluded, therefore, that the conductivity in the wetting state can be greater, equal, or even less than that in the drying state, depending on the particular porous body. (Knapp-USGS)
W69-08760

INFILTRATION AS INFLUENCED BY TILLAGE-INDUCED RANDOM ROUGHNESS AND PORE SPACE,
Agricultural Research Service, Morris, Minn. Soil and Water Conservation Research Div.
R. E. Burwell, and W. E. Larson.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 449-452, May-June 1969. 4 p, 3 fig, 3 tab, 9 ref.

Descriptors: *Infiltration, *Rainfall-runoff relationships, *Soil erosion, *Cultivation, Soil texture, Runoff, Soil physical properties, Permeability, Porosity, Soil conservation, Soil mechanics, Soil stabilization, Surface runoff, Erosion control.
Identifiers: Erosion index, Random roughness.

During simulated rainfall, increases in tillage-induced random roughness and pore space increased water infiltration before runoff started but did not significantly influence infiltration throughout a 5-cm runoff period. Random roughness provided a greater accounting of infiltration variation among tillage treatments to initial runoff than did total pore volume of the tilled layer. Freshly turnplowed alfalfa-bromegrass sod on Barnes loam and Nicollet sandy clay loam soil provided random roughness and pore space conditions that could accommodate without 'failure' the major portion of rainfall energy (as evidence by EI) expected in west central and southwestern Minnesota during the first 2 months following row crop planting. This is the critical r noff-erosion period in the Corn Belt. (Knap USGS)

RECESSION OF PERMAFROST IN A CU TIVATED SOIL OF INTERIOR ALASKA,
Alaska Agricultural Experiment Station, Palm and Soil Conservation Service, Palmer, Alaska.
Arvo Kallio, and Samuel Rieger.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 430-4
May-June 1969. 3 p, 1 fig, 3 tab, 9 ref.

Descriptors: *Permafrost, *Thawing, *Cultivati *Alaska, Soil physical properties, Soil temperatu Soil water, Soil structure, Freezing, Cold regio Frozen ground.
Identifiers: Tanana soil series, Pergelic soils.

Soil temperatures above and within the perennia frozen zones of Tanana silt loam, a member of t subgroup of Pergelic Cryaquepts, were measur twice-weekly over a period of 3 years undisturbed, cleared, perennial grass, and pot plots. The permafrost table receded rapidly fro depth of about 1 m to almost 5 m after clearin Refreezing in autumn and winter takes place sim taneously downward from the surface and upwa from the new permafrost table. In the potato pl an unfrozen zone remained throughout the wint Mean annual temperatures above the new p mafrost table are warmer than 0 deg C. Some re sion in the definition of Pergelic subgroups in t Comprehensive Classification System seems nec sary to avoid a change in classification of the soil a result of clearing and cropping. (Knapp-USGS)
W69-08936

INFLUENCE OF THE COPPER, ZINC, IRO AND ALUMINUM SALTS OF SOME MICRO AL AND PLANT POLYSACCHARIDES ON A GREGATION AND HYDRAULIC CONDUCTIV TY OF RAMONA SANDY LOAM,
California Univ., Riverside. Dept. of Soils and Pla Nutrition.
J. P. Martin, and S. J. Richards.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 421-4
May-June 1969. 3 p, 3 tab, 17 ref.

Descriptors: *Hydraulic conductivity, *Wa chemistry, *Ions, *Organic compounds, *S structure, Wettability, Ion exchange, Soil physi properties, Soil chemical properties, Soil a gregates.
Identifiers: Polysaccharides.

The influence on soil aggregation and hydrau conductivity of some microbial and pla polysaccharides and their Fe, Al, Cu, and Zn sa was determined. Specific effects were depende upon the polysaccharide and the metal ion. general, Fe and Al sharply reduced the effecti ness while Cu and Zn slightly reduced, exerted lit effect or increased their binding acti Chromobacterium violaceum polysaccharide a Karaya gum improved both aggregation a hydraulic conductivity. The polysaccharides fr Azotobacter indicus and Arthrobacter viscosus creased aggregation but did not alter hydrau conductivity. Azotobacter chroococcu polysaccharide in concentrations up to 0.1% i proved hydraulic conductivity but did not affect a gregation while ammonium-alginate exerted no fect on either soil property. (Knapp-USGS)

CONTRIBUTION OF SOME SOIL FUNGI T NATURAL AND HEAT-INDUCED WATE REPELLENCY IN SAND,
California Univ., Riverside. Dept. of Soils and Pla Nutrition.
S. M. Savage, J. P. Martin, and J. Letey.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 405-40
May-June 1969. 5 p, 3 fig, 3 tab, 15 ref

criptors: *Infiltration, *Permeability, *Wetta-
y, *Soils, *Fungi, Temperature, Soil water
ement, Sands, Wetting, Soil chemical proper-
Soil physical properties.
ntifiers: *Water repellent soils.

it species of fungi isolated from a water repel-
soil were incubated for varying periods of time
lica sand. In their latter stages of growth, two of
fungi, Aspergillus sydowi and Penicillium
icans, cause limited water repellency in the
d. All the fungal sand cultures exhibited water
ellency when heated briefly at temperatures
veen 200 C and 400 C. The times required to
duce and destroy water repellency in the sand
ures at the various temperatures were similar to
se required by the natural soil from which the
gi were isolated. The fungal sand cultures and
ural water repellent soils were extracted with
er water, methanol, acetone, or ethyl ether.
methanol and water extractions destroyed the
ural water repellency of the A. sydowi and P.
icans cultures. Methanol and water extractions
destroyed the water repellency of the heated
d cultures if the extractions were made before
heat treatments; however, if the extractions
e made after the sand cultures had been heated,
water repellency of the samples was not af-
ed. Wettable silica sand treated with the
hanol extracts of the sand cultures exhibited
er repellency when heated. Both the heat-in-
ed and natural water repellency of the soil was
affected by any of the solvent extractions, but
table sand treated with each of the extracts was
le water repellent by heat. A variety of known
inic substances was applied to wettable silica
d and the water repellency of the treated sand
rmined before and after heating. Amines were
only class of substances tested that caused
r repellency in sand before heating. A variety
substances, however, caused head-induced
r repellency in the sand. The heating condi-
s required to cause repellency were similar to
e required by fungal sand cultures and natural
er repellent soil. The primary conclusion of the
y was that heat-induced water repellency may
universal property of soils rather than property
ific to a limited number of soils. (Knapp-

Clay decomposition, Mineral losses.

e related but separate phases of work are re-
d. (1) Study of the physical properties of the
of North Carolina. Sixty-nine soil series
senting approximately two-thirds of the total
area of the State were sampled, and the fol-
g determinations made: Depth of the A and B
ons, bulk density, total porosity, hydraulic
luctivity, and the available, the unavailable,
the total water-holding capacities of the A and
rizons. The data should be valuable in planning water control (irrigation and drainage) in erosion control, in various phases of engineering, and in urban development (septic tanks and drainage). (2) Herbicide losses. Suspensions of kaolinite and montmorillonite were treated with two different rates of six herbicides and the amount of herbicide removed in increasing pressure increments determined, using the pressure membrane apparatus. Herbicides used were 2,4-D, simazine, atrazine, diuron, fluometuron, and CIPC. All herbicides, at both rates, were more readily lost from kaolinite than from montmorillonite. Simazine concentrations were greater in the higher pressure increments, but concentration of all others decreased as the pressure increased. (3) Cation and anion losses from clay minerals. Sodium and calcium montmorillonite were suspended in water and in the respective salts. Calcium kaolinite was suspended in water and in calcium chloride. Extracts were obtained at successively increasing pressures and the extracts analyzed for chloride, aluminum, and silicon. Essentially no aluminum was removed at any pressures, but silicon concentration ranged from 10 to 183 ppm. (Author)

2H. Lakes

RESOURCE SUBDIVISION AMONGST COHABITING FISH SPECIES IN A BAY, LAKE OPINICON, ONTARIO,
Queen's Univ., Kingston (Ontario).
Allen Keast.
Mich Univ, Great Lakes Res Div, Pub No 13, p 106-132, 1965. 5 fig, 15 tab, 21 ref.

Descriptors: *Fish, *Fish food organisms, *Food habits, Biomass, Bullheads, Pikes, Rock bass, Shiners, Silversides, Yellow perch.
Identifiers: Black crappie, Bluegill, Smallmouth bass.

The food habits of nine species of fish inhabiting a small bay of 800-hectare Lake Opinicon were determined. Fish were collected at three times during the day from May through September. Collections of plankton and bottom organisms were made in the same area. The diets of the fish species were analyzed by month, fish being grouped into size classes designed to elucidate differences in diet. Abundance of food organisms and number occurring in stomachs (all species of fish combined) were highly positively correlated for Cladocera, Amphipoda, Chironomidae (larvae and pupae) and Mollusca and highly negatively correlated for Copepoda. Cladocera and Chironomidae comprised the major food sources (by number) with Cladocera being utilized by all species of fish. Graphical and tabular data include stomach analyses by per cent volume, detailed diets of all fish species, and relative abundance and biomass estimates of all fish species. (Voightlander-Wis)

THE BOTTOM SEDIMENTS OF LAKE MONONA, A FRESH-WATER LAKE OF SOUTHERN WISCONSIN,
Wisconsin Univ., Madison.
W. H. Twenhofel.
J Sedimentary Petrology, Vol 7, No 2, p 67-77, Aug 1937. 3 fig, 1 tab, 4 ref.

Descriptors: *Bottom sediments, *Fresh water, *Lakes, Sludge, Mud, Marl, Calcium carbonate, Magnesium oxide, Iron, Aluminum, Lithification, Shale, Limestone, Wisconsin.
Identifiers: Organosilicon, Argillaceous limestone, Insoluble matter, Advent of white man, Lake Monona (Wis).

The bottom sediments of fresh water Lake Monona, Wisconsin, consist of a surface layer of black sludge high in organic matter and organosilicon, and a lower layer of firm, light-colored mud or marl. The sludge is composed of 30 to 45% calcium carbonate and 35 to 50% of insoluble residue. The marl contains from 50 to 70% calcium carbonate, 1 to 2% magnesium oxide, 15 to 25% of insoluble residue, and small amounts of iron and aluminum oxides. Lithification of the two layers would produce calcareous shale and siliceous-argillaceous limestone, respectively. The high content of insoluble matter in the sludge is correlated with occupation of the region by white man. (Wilde-Wis)

THE PHYSICAL AND CHEMICAL CHARACTERISTICS OF THE SEDIMENTS OF LAKE MENDOTA, A FRESH WATER LAKE OF WISCONSIN,
Wisconsin Univ., Madison.
W. H. Twenhofel.
J Sedimentary Petrology, Vol 3, No 2, p 68-76, Aug 1933. 3 fig, 3 tab, 2 ref.

Descriptors: *Bottom sediments, *Fresh water, *Lakes, *Chemical analysis, Calcareous soils, Silica, Iron, Aluminum, Organic matter, Diatoms, Microorganisms, Mud, Wisconsin.
Identifiers: Holorganic oozes, Substratum, Lamination, Bedding, Fossil, Organisms, Lake Mendota, Wisconsin.

Sediments covering the bottom of fresh water Lake Mendota, Wisconsin, consist of two distinct layers: the surface layer of nearly holorganic black oozes harboring small, thread-like worms; the substratum of light gray calcareous sediments changing with depth to white marl. The latter fine-grained, mineral sediments are believed to extend to a depth of 35 feet beneath the present bottom. Their average composition includes 60 to 80% carbonate, largely that of calcium, 20% silica, and small amount of iron and aluminum oxides. The empoverishment of the substratum in organic matter is attributed to the activity of microorganisms. Careful search revealed no lamination or bedding of muds. Except for diatoms, marl is almost devoid of fossil organisms. The findings are applicable only to sediments formed in lakes of the same character and located in similar surroundings. (Wilde-Wis)

A COASTAL POND STUDIED BY OCEANOGRAPHIC METHODS,
Woods Hole Oceanographic Institution, Mass.
K. O. Emery.

New York, American Elsevier Publ Co Inc, 1969. 80 p, 9 tab, 41 fig, 75 ref.

Descriptors: *Lakes, *Sediments, *Surface-groundwater relationships, *Life cycles, *Massachusetts, Hydrologic budget, Human population, Aquatid life, Water quality, Organic matter, Water temperature, Stable isotopes, Gases, Saline water, Oceans, Climates, Model studies.
Identifiers: *Oceanographic methods, Woods Hole (Mass), Cape Cod.

This monograph describes an inexpensive backyard model study using Oyster Pond, a coastal body of water on Cape Cod as the ocean. The study cuts through much of the whole field of oceanography; it is suggested that the widespread occurrence of such ponds in the United States and other countries useful environments for oceanographic education since many problems are common to both ocean and the ponds. The history of Oyster Pond is traced to 14,000 years ago; the climate, topography, geology, sediments, and water characteristics are well described. Since precipitation plus groundwater inflow from shoreline seeps and springs greatly exceed evaporation the pond normally overflows about 3,100 cu m per day to the ocean 98% of the time. Inflow of groundwater corresponds to 4 cu m per day per linear m of marine shoreline, a high rate of infiltration due to sandy, very permeable glacial till. Based upon sediment deposition the past 200 yr, Oyster Pond can remain a water body for 4,000 yr more if the sea level remains as now and man's activities do not materially alter the pond. WIND-DRIVEN CIRCULATION IN A TWO LAYER LAKE,
Wisconsin Univ., Madison.
J. A. Hoopes.
Paper presented at Seventh National Fall Meeting of American Geophysical Union, San Francisco, California, December 2-4, 1968. OWRR Project B-009-Wis.

Descriptors: *Interfaces, Limnology, Viscosity, Density, Stratifications, Free surfaces, Wind pressure.
Identifiers: *Steady state circulation model, Near shore boundary currents, Wind shear, Internal friction, Vertical motion.

A theoretical model of the steady-state circulation in a two-layer lake has been investigated. This model, which incorporates the effects of wind shear, internal friction, and vertical motion, is a solution to the linearized equations of motion (i.e., assuming small Rossby number). The eddy viscosity and density are assumed constant in each layer, and the shear, velocity, and pressure are assumed to be continuous across the interface between the layers. Applying the model to a circular lake of constant depth, analytical expressions have been obtained for the three-dimensional velocity distribution and for the shape of the free surface and the interface due to: (1) a steady, uniform wind stress; and (2) a steady, constant curl wind stress. The shape of the interface, as predicted by this model, is in agreement with some experimental observations made in a one-foot diameter, circular cylinder. These results tend to support Csanady's prediction of concentrated, near-shore boundary currents or 'coastal jets' in large lakes (see G. T. Csanady, 'Large-Scale Motion in the Great Lakes', J. Geophys. Res., 72, 4151-4162, 1967); however, Csanady's frictionless model of the circulation predicts more concentrated interfacial depth changes near shore than were observed in the model. (Author)

AN IMPROVED METHOD FOR EXTRACTION OF ORGANOCHLORINE AND ORGANOPHOSPHATE INSECTICIDES FROM LAKE WATERS,
Wisconsin Univ., Madison.
J. G. Konrad, H. B. Pionke, and G. Chesters.
Analyst, Vol 94, May 1969, p 490-492. OWRR Proj B-016-Wis.

Descriptors: *Separation techniques, *Organophosphorus pesticides, *Aldrin, *Dieldrin, *Endrin, Diazinon, Chromatography.
Identifiers: *Gamma-BHC, *Heptachlor epoxide, *Parathion-methyl, Parathion, Malathion.

The sensitivity of a benzene extraction method described previously for the extraction of organochlorine and organophosphate insecticides from lake waters has been increased from 20 to 200 times with little loss in accuracy or reproducibility. Average recoveries of gamma-BHC, aldrin, heptachlor epoxide, dieldrin, endrin, pp'-TDE, PP'-DDT, pp'-methoxychlor, phorate, parathion-methyl, diazinon, parathion and malathion ranged from 93.5 to 99.5 percent at concentrations of 0.062 to 1.165 micrograms per litre, the concentrations being chosen within this range to allow simultaneous gas-liquid chromatographic detection of a mixture of insecticides in a single extraction. Average recovery of heptachlor was 89.4 percent, presumably due to loss of heptachlor from the system by either degradation or volatilization. (Chesters-Wis)

MEASUREMENT OF BIOLOGICAL N2 FIXATION,
Wisconsin Univ., Madison.
R. H. Burris.
Paper presented at Meeting of IBP on Microbial Production, Leningrad, May 27-31, 1969, 9 pages, 3 fig, 12 ref. OWRR Project B-020-Wis.

Descriptors: *Nitrogen fixation, *Lakes, Acetylene reduction, *Soils.
Identifiers: *Lakes, *Nitrogen fixing agents.

The N2 fixing enzyme system reduces not only N2 but also acetylene, azide, N20, cyanide, methyl isocyanide and certain analogues of these compounds. The reduction of acetylene serves as a sensitive index for the activity of the N2-fixing enzyme complex, because the ethylene produced from acetylene can be measured readily by gas chromatography. The method can be applied readily in the field with simple equipment. It has been used for studying N2 fixation in soils, by leguminous and non-leguminous root nodules, by blue-green algae from lakes and by purified enzyme preparations in the laboratory. The manuscript describes methods for sampling, exposure of samples to acetylene and analysis for ethylene production. The investigator should be sure to compare acetylene reduction with N2 reduction to establish a proper conversion factor to permit calculation of N2 fixation. (Author)

MODEL STUDIES AND NUMERICAL SOLUTIONS OF THE CIRCULATION IN LAKE SUPERIOR,
Wisconsin Univ., Madison.
J. A. Hoopes, S. L. Lien, and J. W. Mitchell.
Paper presented at 12th Conference on Great Lakes Research, Ann Arbor, Michigan, May 5-7, 1969. OWRR Project B-009-Wis.

Descriptors: *Lake Superior, *Numerical anal
Identifiers: *Wind-driven circulation, *Su
currents, Two-layer lake, Variable geometry.

The steady, wind-driven circulation in Lake Su
or has been investigated using a rotating, vert
distorted laboratory model and numerical solu
of the equations of fluid motion. The labor
model, which was designed on the basis of eq
of Froude and Rossby numbers between the n
and Lake Superior, was constructed with hor
tal and vertical length scale ratios of 1:300,00
1:1,000 respectively and is rotated at 4.86
Surface currents, generated by blowing air ove
model, are determined by measuring the disp
ments and directions of small floating par
photographically. In experiments with the m
surface currents and streamline patterns have
measured for both a homogeneous and a two-
lake, subject to uniform and constant curl,
stress distributions, though the patterns are
pronounced with the constant curl stress. Fo
homogeneous lake, the predominant feature o
circulation is a strong (up to 2 knots), narrow (
miles wide), counterclockwise current aroun
lake perimeter. For the two-layer lake, delta
phi=0.0005, these same current patterns are
served. In addition, the upper layer forms a na
band 1-10 miles wide around the lake perime
Numerical computations of the free surface an
terface displacements and the vertically integ
volume transports have been made using a
difference form of the steady-state, frictio
equations of motion. These solutions take int
count the variable geometry of Lake Superior
both horizontal and depth variations) and
been carried out for a homogeneous and a
layer lake. The results of these numerical com
tions are in agreement with the experimental o
vations in the laboratory model and with field
servations, principally along the southern sho
the lake. (Hoopes-Wis)

control, Soil stabilization, New Mexico.

The optimum growing conditions for alkali sa
seedlings are 85 deg F and soil moisture at

acity. Five other temperatures and one other moisture level were tested for their effect on ot and root growth, shoot and root weight and lling survival. In another study alkali sacaton llings were subjected to 19 different watering edules representative of summer thundershower ditions. Survival was better after 5, 10, 15, and lays in those pots that were rewatered once. Al- sacaton plants seem to need rewatering after 5 10 days. If they received additional moisture ng this time, survival was much better (91 per- to 99 percent) than if these young plants were ed to go longer before another wetting (Sur- l dropped below 76 percent). ERNAL WATER STATUS OF PLANTS,
raska Univ., Lincoln. Water Resources earch Inst.
y D. Eastin, Charles Y. Sullivan, and E. J. bacher.
ject Completion Rept, July 1969. OWRR Pro- A-005-NEB.

criptors: *Water stress, *Photosynthesis, piration, Carboxylating enzyme.

ghum (Sorghum bicolor (L.) Moench) is a crop wn for its ability to persist under heat and sture stress and often to make productive nomic recovery once stresses are alleviated. mechanisms permitting sorghum and other nts to exist under water stress are not well un- stood and thus cannot be fully exploited. To n perspective in this area whole plant tosynthesis and respiration were estimated by monitoring CO2 exchange as water stress was increased. Also activity of the primary carboxylating enzyme was assayed as water stress increased. Carbon dioxide uptake in light remained comparatively high until leaf water potential approached 20 atmospheres at which time CO2 exchange was near the compensation point. Simultaneously leaf resistance increased from about 0.3 to 0.5 min/cm. A sharp increase in leaf resistance (about 2 min/cm) was noted near 25 atmospheres. Evolution of CO2 in darkness increased 2-3 fold over a normal turgid condition at about 20 atmospheres water potential. As stress increased (> 25 atmospheres) dark CO2 evolution was reduced to a rate comparable to the turgid condition. Dark CO2 uptake was noted but its significance is difficult to assess. Phosphoenolpyruvic carboxylase activity remained quite high as water stress increased. In view of this the rapidly increasing leaf resistances with increasing water stress suggest the limitation observed on photosynthesis is associated with stomatal closure rather than failure of the carboxylation enzyme. BLASTOCLADIA AND AQUALINDERELLA: FERMENTATIVE WATER MOLDS WITH HIGH CARBON DIOXIDE OPTIMA,
California Univ., Berkeley. Dept. of Botany.
A. A. Held, R. Emerson, M. S. Fuller, and F. H. Gleason.
Science, Vol 165, No 3894, p 706-709, Aug 15, 1969. 4 p, 2 fig, 2 tab, 18 ref.

Descriptors: *Plant physiology, *Plant growth, *Carbon dioxide, *Fermentation, Aquatic fungi, Anaerobic conditions, Aerobic conditions, Ecological distribution, Oxygen requirements, Temperature.
Identifiers: *Water molds, Blastocladia, Aqualinderella.

The suggested existence of a polyphyletic group of fermentative water molds adopted to anaerobic environments rich in carbon dioxide has been confirmed by studies described in this paper. The uniflagellate aquatic phycomycete Blastocladia ramosa apparently is a facultative anaerobe. Blastocladia pringsheimii requires oxygen traces. Growth of both species is little or no greater at normal atmospheric oxygen pressure than under 0.2% oxygen pressure, but the addition of 5 to 20% carbon dioxide enhances growth. The cells of both species lack typical cristate mitochondria and contain only traces of cytochrome. Blastocladia resembles the biflagellate Aqualinderella fermentans in adaptation to an environment poor in oxygen and rich in carbon dioxide. (Lang-USGS)

MIDDLE ATLANTIC CONTINENTAL SLOPE OF UNITED STATES: DEPOSITION AND EROSION,
Columbia Univ., Dobbs Ferry, N.Y. Hudson Labs.
Peter A. Rona.
Amer Ass Petrol Geol Bull, Vol 53, No 7, p 1453-1465, July 1969. 13 p, 11 fig, 33 ref.

Descriptors: *Sedimentation, *Erosion, *Continental shelf, *Continental slope, *United States, Marine geology, Sediments, Deposition (Sediments), Stratification, Sediment transport, Sedimentary structures, Groundwater movement, Springs, Aquifers.
Identifiers: Continental slope sediments, *Middle Atlantic shelf.

Continuous seismic reflection profiles across outer continental terrace (outer continental shelf and slope) show that directly off Cape Hatteras reflection interfaces (sedimentary strata) with low seaward inclination of about 1 deg underlie the continental shelf and terminate at the continental slope, which inclines about 9 deg. On traverses about 200 km north of Cape Hatteras, reflection interfaces (sedimentary strata) do not terminate but incline about 3 deg nearly parallel with the continental slope. On the continental slope about 100 km north of Cape Hatteras both relationships are present. The association of erosional and depositional features is consistent with a model of continental terrace development in which strata accumulate on the continental shelf by upbuilding and on the continental slope by outbuilding while basement subsides during seaward tilting. At the continental slope, strata are terminated primarily by erosional processes. Periodically, rotational slumping at the continental slope occurs, causing strata from the slope and outer shelf to shift to the continental rise and exposing shelf strata at the edge of the continental terrace. A COMPUTER PROGRAM FOR GRAIN-SIZE DATA,
Geological Survey, Washington, D.C.; and Woods Hole Oceanographic Institution, Mass.
John Schlee, and Jacqueline Webster.
Sedimentology, Vol 8, No 1, p 45-53, Feb 1967. 9 p, 3 fig, 3 tab, 17 ref.

Descriptors: *Particle size, *Classification, *Computer programs, Data processing, Digital computers, Histograms, Sediments, Sedimentology.
Identifiers: Particle size analysis computer program.

The computer program for sedimentary particle size analysis, used by the Woods Hole Oceanographic Institution-United States Geological Survey Atlantic Continental Margin project, fits a continuous distribution to discrete data by the method of continuous parabolic interpolation. In a few samples, negative size values were computed in the tails of the distribution as a result of this interpolation. To eliminate this difficulty, an exponential interpolation was substituted whenever negative values occurred in the tails. From the interpolated size data, moment measures were then calculated to characterize the size curve. When interpolated values as well as original measurements were used, rather than original measurements alone, the moment measures more truly represent the characteristics of the size distribution. THE PRESENTATION OF SUBJECTIVE SHAPE AND ROUNDNESS DATA,
City Univ., London (England).
I. J. Smalley.
Sedimentology, Vol 8, No 1, p 35-38, Feb 1967. 4 p, 1 fig, 5 ref.

Descriptors: *Sediments, *Particle shape, *Classification, Measurement, Dimensions, Estimating, Test procedures.
Identifiers: Particle shape calssification scheme, Zingg particle-shape classification.

If a modified version of the Zingg system is used particles can be subjectively classified into four shape classes. The roundness of a particle can be estimated by assessing the flat/convex/concave ratio and can then be represented as a point on a triangular net; this point can also indicate the Zingg class of the particle. This paper presents pertinent data and illustrates the results of a shape and roundness analysis carried out on a sample of 100 pebbles from Hythe (Kent) beach, England. (Knapp-USGS)

RIPPLE MARK INDICES AND THEIR USES,
Florida State Univ., Tallahassee. Dept. of Geology.
W. F. Tanner.
Sedimentology, Vol 9, No 2, p 89-104, Sept 1967. 16 p, 4 fig, 19 ref.

Descriptors: *Ripple marks, *Classification, *Sedimentary structures, Shape, Currents (Water), Waves (Water), Winds, Sand waves, Sedimentary petrology, Bed load, Dunes, Sediment transport, Shear, Turbulence.
Identifiers: Ripple-mark classification, Symmetry.

A sedimentary ripple-mark classification is presented to use in identifying sedimentary accumulation environments by measuring various aspects of ripple mark geometry. Current ripple marks are easily separated from wing, wave, and swash marks. Current ripple marks have different parallelism, symmetry, straightness, and continuity from the other types, because current marks are shaped primarily by unidirectional eddies while wind, wave, and swash marks are controlled largely by shear movement. The parameters defined for ripple identification are ripple index, ripple symmetry index, continuity index, bifurcation index, straightness index, and 2 parallelism indices. (Knapp-USGS)

SIMULATION OF RIVER CHANNEL DEFORMATIONS,
State Hydrological Inst., Leningrad (USSR).
K. I. Rossinskiy.
Soviet Hydrol: Selec Pap, Issue No 2, p 101-114, 1968. 14 p, 5 fig, 10 ref. Trans Trudy Gos Gidrol Inst, No 143, p 186-203, 1968.

Descriptors: *Model studies, *Hydraulic models, *Sediment transport, *Channel erosion, *Hydraulic similitude, Reynolds number, Froude number, Channel morphology.
Identifiers: USSR, Channel phenomena simulation.

The rules for simulating channel phenomena on erosible models are described, the difficulties involved are discussed, and ways of overcoming them are outlined. Channel processes cannot be reproduced exactly on soft models so that approximate simulation must be resorted to. Methods of approximate simulation depend on the specific problems to be solved. Several approaches to simulation in specific cases are described. Modeling of river channels requires hydraulic similarity of river regime, sediment movement, and channel deformation. To achieve hydraulic similarity, it is necessary to duplicate the Droude, Reynolds, Stroudal, and Euler numbers. It is practically impossible to satisfy the Froude and Reynolds conditions simultaneously. Reynolds numbers must be large enough so that, model phenomena be in the self-similarity region. (Knapp-USGS)

Identifiers: *USSR, Channel conveyance capacit

Most of the hydrometric data on river regimes late to individual cross sections at gaging statio The basic information obtained consists of me sured water discharges. Computations of chan deformations, the conveying capacity of the ch nel, the plotting of curves of the free surfa require more than data on the hydraulic eleme at a single cross section; they require knowledge their variation along the stream. Because hydrau data are not readily interpreted to yield chan storage, determination of channel conveyan from the discharge curve is complicated. Bott deformation and the inconsistency of the slopes the free surface and of hydraulic resistances, a other factors that change the character of the re tionship between discharges and water levels, w be fully defined only by analysis of the chan process over a sufficiently long river reach. Calc lation of the dynamic structure of nonuniform flo is necessary for determination of channel capaci and for determination of the locations of the cro section and the base line for measurement of t free surface slope. IMENTARY ENVIRONMENTS AND UN-NSOLIDATED CARBONATE SEDIMENTS THE FRINGING CORAL REEFS OF MAHE, CHELLES,
gow Univ. (Scotland). Dept. of Geology.
hael Samuel Lewis.
ine Geol, Vol 7, No 2, p 95-127, Apr 1969. 33 4 fig, 37 ref.

criptors: *Sedimentation, *Coral, *Reefs, lcium carbonate, Sedimentology, Marine nals, Provenance, Sediment transport, Deposi- (Sediments), Currents (Water), Waves ter), Particle size, Turbulence, Channels, ds.
tifiers: Seychelles Islands.

ensive fringing coral reefs occur around Mahe, largest island in the Seychelles Archipelago. eral sedimentary environments, which are best eloped on reefs exposed to the Southeast Mon- (the dominant wind), are associated with the s. These are the beach, rippled sand zone, ine grass bed, radial zone, algal ridge, reef e, reef slope, 'plateau', mangrove and former grove swamps, deltas, channels, and the fore- environment. Skeletal carbonate sands form a eer on the reef flats and are widespread in the -reef environment. Locally they pass into rtz sands. Current transportation is dominantly lward, with little material being carried from reef flats into the fore-reef and channel en- nments. It is often difficult to relate the grain- measures of the sediments to their environ- t of deposition. The turbulent conditions in the ch, algal ridge and reef edge environments are ected in the absence of fine material and the dispersion values of the associated sediments. ss bed samples have high dispersion values and relatively rich in fines trapped by the grasses. ial zone samples show much variation in grain- measures due to the diversity of the conditions leposition. The skewness in mangrove swamp ments is positive, indicating normal current osition. Sheltered fore-reef deposits tend to be in fines and to have positive skewness values to the quiet conditions, whereas fine material is nowed from windward fore-reef sediments. (K- p-USGS)

SOME HYDRAULIC PROPERTIES OF BIOCLASTIC CARBONATE GRAINS,
Calgary Univ. (Alberta). Dept. of Geology.
W. R. Maiklem.
Sedimentology, Vol 10, No 2, p 101-109, Mar 1968. 9 p, 4 fig, 11 ref.

Descriptors: *Sediments, *Settling velocity, *Sediment transport, *Carbonates, *Particle shape, Suspension, Tractive forces, Particle size, Carbonate rocks, Coral, Algae, Sands, Gravels.
Identifiers: Carbonate grains, Bioclastics.

A simple experiment demonstrates that shape and bulk density of bioclastic carbonate grains are important factors affecting the grain-size distribution of a clastic carbonate sediment deposited in water. Settling velocities of bioclastic carbonate grains divided into shape groups--blocks, rods, spheres, and plates--have been compared to calculated settling velocities of calcite and aragonite. It was found that calculated settling velocities are up to 4 times greater than actual velocities. Block-shaped grains (coral and coralline algae) show the least differences; calculated velocities are as much as half greater for fine to medium sand grains but the same for gravel. Plate shaped grains of the foraminifera Marginopora have the largest differences; calculated velocities are about twice greater for sand and about 4 times greater for pebbles. The differences in settling velocities can be accounted for by shape, bulk density, and settling motion. Settling motion, in turn, is related to shape. (Knapp-USGS)

ERRORS IN USING MODERN STREAM-LOAD DATA TO ESTIMATE NATURAL RATES OF DENUDATION,
Geological Survey, Woods Hole, Mass.
Robert H. Meade.
Geol Soc Amer Bull, Vol 80, p 1265-1274, July 1969. 10 p, 9 fig, 56 ref.

Descriptors: *Sediment load, *Erosion, Rivers, Cultivated lands, Sedimentation, Silting, Aggradation, Provenance, Sediment distribution, Sediment yield.
Identifiers: Potomac River, Eastern U.S., Denudation rates.

The practice of calculating natural rates of denudation from routinely collected data on the loads of suspended and dissolved matter in modern rivers is subject to several significant errors. The sources of these errors are demonstrated by examples from the Atlantic drainage of the United States, where their total effect has apparently doubled the natural rate of erosion. The largest error is caused by assuming that modern sediment loads in populated areas represent natural erosion, whereas in fact they mainly reflect the influence of man. Conversion of forests to croplands in the middle Atlantic states causes about a 10-fold increase in sediment yield. Coal mining, urbanization, and highway construction have added extra loads of sediment to the streams. Modern sediment loads in the Atlantic-draining rivers are probably 4 to 5 times greater than they would be if the area had remained undisturbed by man. Errors in calculating the chemical denudation are caused by atmospheric contributions to the dissolved loads of streams and by pollutants that are added directly to stream waters. About 1/4 of the salts in Atlantic-draining streams were contributed from the atmosphere, either as recycled sea salts or as pollutants and soil dust that originally became airborne as a result of the activities of man. Perhaps another 1/10 of the dissolved load consists of industrial and agricultural wastes or acid mine waters that have been added directly to the streams. (Knapp-USGS)

A GREENHOUSE STUDY OF RELATIONS BETWEEN NUTRIENT MOVEMENT AND CONVERSION IN A SANDY SOIL AND THE NUTRITION OF SLASH PINE SEEDLINGS,
Forest Service (USDA), Olustee, Fla. Southeastern Forest Experiment Station; and Yale Univ., New Haven, Conn. School of Forestry.
George W. Bengtson, and Garth K. Voigt.
Proc Soil Sci Society of America, Vol 26, p 609-612, 1962. 3 tab, 14 ref, disc.

Descriptors: *Lysimeter, *Fertilizers, *Cycling nutrients, Leaching, Water treatment, Urea, Transpiration.
Identifiers: Slash pine, Potassium-calcium pyrophosphate, Ammonium nitrate, Potassium chloride, Loss of nutrients.

A greenhouse lysimeter study was made of the stability of different nitrogen-phosphorus-potassium fertilizers against their removal by leaching and the availability of nutrient elements to slash pine seedlings growing in Lakeland fine sand. Leachate analyses showed that nearly all ammonium nitrate and potassium chloride applied to surface soil in bare lysimeters were leached from the upper 12 inches within four weeks when water was applied at the rate of 4 inches per week. At the same watering rate, urea-formaldehyde and potassium calcium pyrophosphate showed substantially lower leaching losses. The growth of pine seedlings prevented or reduced leaching of nitrogen and potassium at watering levels of 1 and 2 inches per week, but at a watering rate of 4 inches per week, the seedlings were relatively ineffective in reducing nutrient losses. Fertilized seedlings transpired from 30 to 80% more water than the controls, yet their water use per gram of dry matter produced was 25 to 50% less than that of unfertilized seedlings. (Wilde-Wis)

CLATHRATE HYDRATES OF AIR IN ANTARCTIC ICE,
California Univ., San Diego, La Jolla. Dept. of Chemistry.
Stanley L. Miller.
Science, Vol 165, No 3892, p 489-490, Aug 1969. 2 p, 1 fig, 15 ref.

Descriptors: *Clathrates, *Ice, *Glaciers, *Antarctic, *Hydrate processes, Air, Hydrates, Oxygen, Nitrogen, Bubbles, Solubility.
Identifiers: Antarctic ice bubbles.

Measurements of the dissociation pressure of nitrogen hydrate and oxygen hydrate show that a clathrate hydrate of air should exist below about 800 meters in the Antarctic ice sheet. This accounts for the disappearance of gas bubbles at depths greater than 1200 m. The hydrate should exist from this depth to the bottom of the core and should constitute 0.06% of the ice. THERMODYNAMICS OF HYDROTHERMAL SYSTEMS AT ELEVATED TEMPERATURES AND PRESSURES,
Northwestern Univ., Evanston, Ill. Dept. of Geology.
Harold C. Helgeson.
Amer J Sci, Vol 267, No 7, p 729-804, Summer 1969. 76 p, 21 fig, 14 tab, 162 ref.

Descriptors: *Water chemistry, *Aqueous solutions, *Chemical potential, *Chemical reactions, *Geochemistry, Mineralogy, Thermodynamics, Saline water systems, Thermodynamic behavior.
Identifiers: *Hydrothermal reactions, Hydrothermal ore deposits.

Chemical relations in hydrothermal systems can be described in terms of the thermodynamic properties of minerals, aqueous species, gases, and concentrated sodium chloride solutions. Sufficient thermodynamic data are available to permit calculation of equilibrium constants for a large number of hydrothermal reactions at high temperatures and pressures. Where these data are incomplete, the calculations involve entropy estimates, application of average heat capacities, and/or assumptions concerning the temperature dependence of thermodynamic variables and the relative importance of electrostatic and non-electrostatic interaction among the aqueous species in hydrothermal solutions. High temperature stoichiometric activity coefficients for individual ions can be calculated using deviation functions computed from osmotic coefficients for concentrated sodium chloride solutions. The results of such calculations, together with computed heat capacities, enthalpies, entropies, and equilibrium constants for many hydrothermal species and reactions at high temperatures are presented in tables and diagrams. The methods, assumptions, and equations employed in the calculations are summarized in general notation. The numerical information contained in the tables permits calculation of the solubilities of silicates, sulfides, carbonates, sulfates, and oxides in multicomponent hydrothermal solutions containing high concentrations of sodium chloride at elevated temperatures, and evaluation of the mass transfer accompanying irreversible reactions responsible for metasomatism and ore deposition in hydrothermal systems. THE COURSE OF SELF-PURIFICATION PROCESS OF CANALIZED, HIGHLY POLLUTED RIVERS,
H. Manzack.
Water Res, Vol 2, No 1, p 3-4, Jan 1968. 2 p.

Descriptors: *Self-purification, *Channeling, *Stream pollution, *Water quality, Biochemical oxygen demand, Dissolved oxygen, Reaeration, Navigable river, Aerobic conditions, Anaerobic conditions, Weirs.
Identifiers: *Poland, *Odra River, Self-purification process.

A study to establish the capacity of self-purification in channeled and unchanneled sections of Odra River, Poland is described. Hydrographic, hydrometric, chemical and biological measurements in the river showed: (1) Ice cover reduced the biochemical processes; (2) The coefficient of oxygen utilization in polluted water was about half that from unpolluted water; (3) This coefficient decreased sharply during the navigable period; (4) The reaeration process was much lower in channeled sections of the river than in unchanneled sections; (5) The self purification capacity was relatively high in unchanneled sections, without ice; (6) The self purification coefficient decreased in polluted water during summer and autumn only in the areas with high initial BOD values. It is concluded that canalization of Odra River has positive and negative features, of which the weirs which increase the amount of dissolved oxygen is the most important. The channel has negative effects such as accumulation of bottom sediment, hydrogen sulphide and occurrence of oxygen defficiency. (Carstea-USGS)

COMPOSITIONAL SIMILARITIES BETWEEN HOT MINERAL SPRINGS IN THE JORDAN AND SUEZ RIFT VALLEYS,
Israel Atomic Energy Commission, Rehovoth; and Weizmann Inst. of Science, Rehovoth (Israel).
Emanuel Mazor.
Nature, Vol 219, No 5153, p 477-478, Aug 3, 1968. 2 p, 2 fig, 7 ref.

Descriptors: *Hot springs, *Water chemistry, *Mineral water, Seawater, Mixing, Groundwater, Chemical reactions, Thermal water, Aqueous solutions, Geochemistry, Saline water systems.
Identifiers: *Israel, Dead Sea, Red Sea, Lake Tiberias, Tiberias hot spring, Hamman Farun hot spring.

The chemical composition of water from Hammam Farun hot spring in the Suez Rift Valley, Israel is almost identical to that of waters from Tiberias hot springs in the Jordan Rift Valley. Springs in the rift valleys have very similar waters although their source rocks and structural geology are not similar. It has been suggested that in the geological past, seawater flooded the rift valleys and infiltrated the tectonically shattered rocks, and reaction of the trapped seawater with host rocks and native groundwater produced the present spring water. Finding similar water in springs of another rift valley supports the suggestion. Experiments on sea water mixed with rock samples resulted in formation of waters similar to the spring waters, which are depleted in Mg and Na, and enriched in Ca, Sr, Li, Br, sulfate, and Ra, relative to seawater. SULPHATE REDUCTION IN WATERLOG SOILS,
Rothamsted Experimental Station, Harpe (England).
C. Bloomfield.
J Soil Sci, Vol 20, No 1, p 207-221, Mar 196 p, 8 fig, 3 tab, 35 ref.

Descriptors: *Saturated soils, *Sulfates, *W chemistry, *Biodegradation, *Sulfur bact Anaerobic bacteria, Sulfides, Hydrogen sulfide ganic matter.
Identifiers: Sulfate reduction, Desulfovibrio.

To study the factors that influence the relea free hydrogen sulfide, flooded soils were incub with plant material and either sodium sulphat elemental sulfur. Residual sulphate, FeS hydrogen sulfide were measured throughout reaction. Less free hydrogen sulfide was evo from a periodically waterlogged soil than fr well-drained soil comparable HCl- and dithio soluble Fe content. With a readily soluble synth iron oxide as the source Fe, a slight excess o over the sulfate-equivalent sufficed to prevent of hydrogen sulfide. The native organic matt the well-drained Rothamsted top-soil seeme have no effect in promoting loss of hydrogen fide, but the FeS: hydrogen sulfide ratio strongly influenced by the nature of the material used as the source of energy. With c sodium sulfate or S, considerably more hydrogen sulfide was evolved with lucerne with rice blade. With S, the pH of the incut mixtures was close to that of the nominally S system, whereas with sodium sulfate the mi became quite alkaline. More free hydrogen su was evolved under the more alkaline condition tained with sodium sulfate, which suggests tha the initial mobilization of Fe that governs the tribution of the reduced S, rather than the pH-l bility relations of FeS. An oxidized surface la very effective in retaining sulphur in the soil napp-USGS)

CATIONS AND SILICA IN NATURAL WATERS: CONTROL BY SILICATE MINERALS,
Johns Hopkins Univ., Baltimore, Md.
Owen P. Bricker.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 110-119, 1968. 10 p, 9 fig, 2 tab, 7 ref.

Descriptors: *Water chemistry, *Streams, *Chemical reactions, *Equilibrium, Leaching, Solutes, Aqueous solutions, Weathering, Mineralogy, Silicates.
Identifiers: *Silicate-water equilibria.

Reactions of water and silicate minerals control the composition of natural groundwater and surface waters. Silicate-water systems react at measurable rates in the laboratory and the final water composition is determined by the solid phases present in the system. In the natural system investigated, a small wooded watershed near Baltimore, Md., the major portion of the dissolved load of the stream is derived from rock weathering. Carbon dioxide-charged rain reacts rapidly with the silicate minerals in the bedrock and soil, producing solids more aluminous than the original silicates; the solution is enriched in dissolved silica, cations and bicarbonate ion. Aluminum is conserved in the solid phase. Most of the dissolved silica in the stream is derived from the breakdown of oligoclase feldspar even though quartz is the major silica mineral in the rock. The reaction of water with silicates is so rapid that the waters remain in near-equilibrium with one or more solid phases at all times. In this watershed the rate of removal of material as dissolved load is about 5 times greater than the rate of mechanical removal. (Knapp-USGS)

EFFECTS OF SUSPENDED MATERIAL ON WATER QUALITY,
Kansas Univ., Lawrence. Dept. of Civil Engineering; and Kansas State Geological Survey, Lawrence.
Ernest E. Angino, and Walter J. O'Brien.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 120-128, 1968. 9 p, 5 fig, 17 ref.

Descriptors: *Suspended load, *Water quality, Water chemistry, Equilibrium, Aqueous solutions, Turbidity, Hardness (Water), Color, Odor, Taste, Photosynthesis, Aquatic life, Adsorption, Absorption, Sediments, Dissolved oxygen.
Identifiers: Suspended contaminants (Water).

Some of the effects of suspended load on stream water quality are summarized. The suspended material contributes to turbidity, hardness, alkalinity, water color, affects photosynthetic activity, and may be harmful to some organisms. In obstructing the penetration of light it induces a reduction in photosynthesis and indirectly causes a change in the oxygen content of the stream. The suspended load may act as substrate for bacteria, fungi, and other microorganisms as well as influence the concentration of certain compounds by sorption. Study of the suspended load of rivers draining the Cretaceous chalk terrain of Western Kansas showed that at certain times of the year a large part of the load is calcite. At other times considerable amounts of quartz, clays, and organic debris make up the river load. The calcite was a clearly identified component in transported sediments of the Kansas River as much as 150 mi east of the eastern limit of Cretaceous outcrops. Considering the solubility of calcite, any solution of the suspended calcite influences the Ca, Mg, pH, and bicarbonate values of these streams and thereby stream hardness. A relatively constant K and Mg content suggests a possible positive control by exchange reactions with the clayload of the streams. Similar affects on the nitrate, phosphate, and possibly sulfate concentration are to be expected from seasonal changes in the organic content of streams. Presently we know few of the detailed mechanisms by which suspended material has any effect on the water quality of the water carrying it. (Knapp-USGS)
W69-08915

RELATIONS BETWEEN SUSPENDED MATTER AND SALINITY IN ESTUARIES OF THE ATLANTIC SEABOARD, U.S.A.,
Geological Survey, Woods Hole, Mass.
Robert H. Meade.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 96-109, 1968. 14 p, 10 fig, 2 tab, 34 ref.

Descriptors: *Suspended load, *Salinity, *Estuaries, *Atlantic coastal plain, Delaware River, Silts, Clays, Saline water-freshwater interfaces, Chemical precipitation, Flocculation, Water chemistry, Turbulence, Currents (Water), Tides.
Identifiers: Potomac River, Chesapeake Bay.

Despite the suggestion by laboratory experiments that suspended matter in rivers is flocculated and deposited where it reaches saltwater, the concentrations of suspended matter in estuaries associated with some moderately large rivers of the Atlantic seaboard show no accelerated decrease that can be attributed to salt flocculation. Velocities of the estuarine waters are apparently sufficient to obscure the expected effects of salinity and keep the material in suspension. The general decrease in suspended matter associated with increasing salinity in the seaward direction can be attributed to the simple dilution of river suspensions by seawater. Superimposed on the general seaward decrease in suspended concentration is a maximum concentration near the upstream limit of sea salt. Suspended concentrations decrease both upstream and downstream of the maximum. This maximum has been found at one time or another in all the estuaries that have been sufficiently studied. It seems to reflect the accumulation of suspended matter near the salt limit by net landward flow along the estuary bottom. (Knapp-USGS)

GRAPHICAL METHODS FOR STUDY OF DISSOLVED ALUMINUM COMPLEXES,
Geological Survey, Washington, D.C.
John D. Hem.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 15-23, 1968. 9 p, 5 fig, 9 ref.

Descriptors: *Water chemistry, *Aluminum, *Ions, Fluorides, Sulfates, Chemical potential, Chemical reactions, Geochemistry, Hydrogen ion concentration, Aqueous solutions.
Identifiers: Aluminum ions.

The distribution of ionic species in dilute solutions at 25 deg C and 1 atmosphere pressure can be computed by mathematical procedures based on the law of mass action and related thermodynamic equations. The computations require some knowledge of concentrations of ions and the forms of complexes or ion-pairs, and their stability constants, or their free energies of formation. Sufficient information is now available to permit accurate computations of the amount and form of dissolved species of many constituents of natural water. Graphs can be prepared which give relatively simple and direct insights into the details of natural water chemistry. Examples show the solubility of aluminum in relation to pH, the dominant dissolved forms of aluminum in solutions containing various concentrations of fluoride, and the propor-

tions of uncomplexed to total dissolved aluminum in such solutions. Graphs also are given showing the interrelated complexing effects of fluoride and sulfate and fluoride and hydroxide. (Knapp-USGS)

SOME QUESTIONS CONCERNING GEOCHEMICAL HYDRODYNAMICS,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
N. N. Verigin, and B. S. Sherzhukov.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 42-53, 1968. 12 p, 28 ref.

Descriptors: *Water chemistry, *Diffusion, *Dispersion, *Groundwater movement, Ion exchange, Mass transfer, Convection, Flow, Mixing, Density, Ion transport, Osmosis, Soil moisture, Soil water.
Identifiers: Geochemical hydrodynamics.

The migration and diffusion of solutes in moving groundwater and the mass transfer of ions between groundwater and rock minerals are discussed. Diffusion and sorption equations are derived theoretically and their solutions are compared with the results of field observations. Equations are given for 2-dimensional convective diffusion, sorption, flow of miscible fluids, solution at surfaces, and ion exchange. (Knapp-USGS)

DISSOLVED MATTER DISCHARGE AND MECHANICAL AND CHEMICAL EROSION,
Gidrometeorologicheskii Institut, Leningrad (USSR).
O. A. Alekin, and L. V. Brazhnikova.
Symp Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 35-41, 1968. 8 p, 4 tab, 10 ref.

Descriptors: *Dissolved solids, *Salts, *Water chemistry, *Weathering, Aqueous solutions, Solutes, Sediment load, Geochemistry.
Identifiers: *USSR, Chemical weathering.

The total quantity of salts discharged from rivers of the USSR is computed and compared to the total world discharge of salts. From the composition and amount of salt discharge, the amount of weathering is calculated. The world's yearly discharge of sediments is estimated to be 19,700 million tons, and of dissolved solids, 2,500 million tons. Calculated dissolved loads of river basins of the USSR and continental totals for the rest of the world are tabulated. (Knapp-USGS)

MPARATIVE COST EVALUATION OF SALTED WATER SUPPLY VERSUS ALTER-TIVE FRESH WATER SUPPLY FROM A NVENTIONAL SOURCE,
as Water Development Board, Austin.
nald E. Morris.
, Fiftieth Annu Meet Amer Geophys Union, 1969. 20 p, 5 fig, 5 ref.

criptors: *Demineralization, Desalination nts, Water resources, *Cost comparisons, ater supply systems, Water quality, Water wells, elines, Pumping plants, Pre-treatment (Water), ne disposal, Water treatment, Economic justifi-on, Chemical properties, Water sources, Main-ance, Amortization, Capital costs, Operating s.
ntifiers: Water quantities, *Texas Water elopment Board, Texas Water Plan.

osting procedure was developed during desalt-studies in Texas, for comparing the cost of a er supply produced by saline water conversion inst the cost of providing a fresh water supply n a conventional source. For desalting, the ele-nts included in the costing procedure were: (1) l fields for saline feedwater supply; (2) an in-e system and pumping station; (3) pipelines; (4) treatment for saline water; (5) a desalting plant; (6) brine disposal. For a conventional water ply system, the elements of cost included: (1) water cost; (2) a well field or intake system; pipelines and pumping stations; and (4) a con-tional water treatment plant. The final nomic justification of a desalting project may ude: chemical quality comparisons, secondary efits, and projected life comparisons with future ilability of alternative supplies. The Texas ter Development Board considers desalting a practical solution to the interim water supply blems that exist in many areas of the state. BR)

SELECTIVE CONTROL OF BRUSH ON CHAPARRAL WATERSHEDS WITH SOIL-APPLIED FENURON AND PICLORAM,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
Edwin A. Davis, and Charles P. Pase.
USDA Forest Serv Res Note RM-140, 1969. 4 p.

Descriptors: *Herbicides, *Chaparral, *Brush control, *Water yield improvement, Forest management, Watershed management, Pesticides, Agricultural chemicals, Chemicals, Urea pesticides, Wildlife management, Habitat improvement, Soil treatment, Brush.
Identifiers: *Fenuron, *Picloram.

Pelleted fenuron and picloram were applied by hand as spot treatments to increase water yield. Desirable browse species for big game can be retained by this method. Picloram, at half the application rate of fenuron, was less toxic than fenuron to the oaks, but more toxic to the other shrubs. Season of application, particularly as it relates to precipitation pattern is important in the performance of soil-applied herbicides in Arizona. Two natural products of chaparral watersheds are water and big game. To achieve a maximized balanced output of these products it is proposed that a nonselective brush eradication treatment be followed by grass and browse establishment programs. This approach would allow the establishment of specific browse shrubs in desired densities for a maximized balanced output of water and game. (Authors)

INCREASING WATER YIELD FROM FOREST, CHAPARRAL, AND DESERT SHRUB IN ARIZONA,
C. P. Pase, and Martin M. Fogel.
Int Conf on Water for Peace Proc, Vol 2, p 753-764, 1967. 12 p, 6 fig, 5 ref. For 8-volume proceedings see Vol 2, No 9, 06B, W69-03305.

Descriptors: *Arid lands, *Watershed management, Arizona, Demonstration watersheds, Runoff, Small watersheds, Caliche, Hand pan, Evaporation control, Evapotranspiration control, Soil-water plant relationships, Water yield improvement, Cutting management, Flow augmentation, Chaparral, Grasslands, Coniferous forests, Deserts.
Identifiers: *Vegetation manipulation, Sodium chloride.

Increasing human water needs in arid lands have stimulated research on vegetation and soil surface manipulation to decrease evapotranspiration and soil surface evaporation. Extent and composition of forest, chaparral and desert shrub in Arizona are outlined. A commercial timber harvest, 45% basal area, did not significantly increase water yield; but, conversion of moist-site mixed conifers to grass increased stream flow 8.4 cm/yr. Previously burned dense chaparral increased water yields 8 to 25 cm/yr after conversion to grassland. Supression of shrubs with annual (4) aerial application of 2,4,5-T permitted development of herbaceous cover. An increase of 1.2 cm of surface runoff was obtained in desert shrub vegetation areas with the application of sodium chloride to alter infiltration characteristics of the surface soil. Runoff water was of excellent quality for agricultural use. (Sherbrooke-Ariz)

3C. Use of Water of Impaired Quality

TOWARD FULL WATER UTILIZATION IN SAUDI ARABIA,
H. E. Hassan Mishari.
Int CONF on Water for Peace, Vol 2, p 832-841, 1967-68. 10 p, 2 fig. For 8-volume proceedings see Vol 2, No 9, 06B, W69-03305.

Descriptors: *Water resources development, *Water resources planning, *Groundwater, Deserts, Aquifer characteristics, Deep wells, Irrigation programs, Saline water, Desalination, Water utilization efficiency.
Identifiers: Saudi Arabia.

This is a review of water problems and governmental interest in water development in a desert kingdom. A general hydrogeological sketch includes discussion of 'fossil' water, geologic down-dip, and coastal brackish underground waters. Saudi experts and teams of experienced international experts and consultants are employed in the evaluation of the groundwater resources. The major methods of investigation are costly drilling and aquifer testing. AQUIFER COEFFICIENTS OF STORAGE AND TRANSMISSIBILITY WILL BE CALCULATED. Chemical composition, recharge, and isopiezometric surface of the different aquifers will be studied. Potentialities of subsurface dams and infiltration galleries are being investigated. A discussion is presented of water development projects in progress, which include land reclamation, irrigation, drilling, flood control, municipal and stock water supplies and desalination. Water costs are considered in relation to use. (Sherbrooke-Ariz)

PRACTICAL APPLICATION OF FOAM FRACTIONATION TREATMENT OF LOW QUALITY WATER,
Alaska Univ., College. Inst. of Water Resources.
R. Sage Murphy.
Completion Report to Office of Water Resources Research, Department of the Interior, Washington, DC, August 1969. 11 p. OWRR Proj No A-024-ALAS.

Descriptors: *Foam fractionation, *Flotation, *Deferrization.

A foaming technique, using ethylhexadecyldimethylammonium-bromide, bubble aeration, no reflux or recycle, and ground waters was tested for iron removal efficiencies. The intent of the project

was to utilize local materials and labor, as found in remote Alaskan areas, for the construction of the batch treatment process. Although previous laboratory studies indicated the process was satisfactory, field tests were unsatisfactory and further development is deemed unwarranted. Some function of water temperature is believed to have inhibited the reaction. Since close temperature control would be uneconomical for the purpose intended for the unit, the attempt to sophisticate the system was abandoned. The best results obtained in the prototype unit removed 61.9 percent of the iron, leaving a residual of 7.8 mg/l, 20 times the minimum USPHS standard. Most runs achieved, on the average, 11.15 percent iron removal, equivalent to a residual of 23.54 mg/l Fe++. (Author)

NUCLEAR ENERGY AND THE AGRO-INDUSTRIAL COMPLEX,
Oak Ridge National Lab., Tenn.
Alvin M. Weinberg.
Nature, Vol 222, No 5188, p 17-21, Apr 1969. 5 p, 3 fig, 2 tab, 4 ref.

Descriptors: *Nuclear energy, *Agriculture, Industries, Wheat, Crops, Nuclear engineering, Desalination, Demineralization, Water costs, *Crop production, Charts, Grains (Crops), *Electric power, Powerplants, *Agronomy, *Nuclear powerplants, Experimental farms, Professional personnel, Demonstration farms.
Identifiers: Breeder reactors, Israel, Great Britain, *Nuclear power, Tables (Data), Nuclear desalination devices.

Scientists at the Oak Ridge National Laboratory, Tenn, believe that a nuclear-powered agro-industrial complex could be an instrument for social and economic improvement in underdeveloped countries and a means for providing more food for the world's growing population. This complex would consist of an integrated collection of heavy chemical industries clustered around large reactors and desalting plants, and associated with a highly mechanized, scientific farm. The farm would essentially be a food factory. Initial studies are underway to locate such complexes in the Gujarat Peninsula in India and the southeastern rim of the Mediterranean. Israel has plans for 2 experimental farms in Negev where scientific agriculture, based on using distilled water for irrigation, is to be conducted. Tables and charts showing costs of distilled water, crop water-yield relationships, and cost details and sensitivity of agro-industrial complexes are given. (USBR)

COST OF PUMPING IRRIGATION WATER IN TEN NEW MEXICO COUNTIES,
New Mexico State Univ., University Park. Dept. of Agricultural Economics.
Roger B. Long.
Agricultural Experiment Station, New Mexico State University, Bulletin 490, March 1965. 43 p, 13 fig, 29 tab, 1 append, 4 ref.

Descriptors: *Pumping, *Irrigation, *Average costs, Water yield.
Identifiers: *New Mexico.

This study determined the average costs of pumping irrigation water. Also, the relation of these costs to pump yield was studied. Data were obtained through personal interviews with farmers. The average costs per acre-foot of water pumped in ten counties were reported. A description of the crops, physical irrigation characteristics, and costs of each county studied were included. In the conclusion pump costs are related to pump yields so that farmers can tell how their costs will change when they increase or decrease their pump yields. (Grossman-Rutgers)

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

MAYNARD V HAWLEY (SUIT TO ENJOIN DRAINAGE OF WATER UPON LAND).

331 Mich 123, 49 NW2d 92-95 (1951).

Descriptors: *Michigan, *Surface drainage, *Road construction, *Surface runoff, Drainage engineering, Drainage, Ditches, Culverts, Channels, Surface water, Highways, Roads, Swamps, Rain water, Ponds, Flooding, Legal aspects, Judicial decisions.
Identifiers: Injunction.

A newly constructed highway separated plaintiff's land from the higher land of the defendant. Suit was brought to enjoin defendants' (private landowner and county road commission) drainage of water from higher property onto plaintiff's land. The court first noticed that the highway commissioners had the right to drain surface water, falling or naturally coming upon the highway, through natural and usual channels upon and over lower lands. Drains could be constructed for such purpose. The court held that the evidence sustained the finding that the ditches and culverts did not increase the amount of water flowing upon the land involved, but rather such land received substantially the same amount of surface water which it had received for years past. The court affirmed the findings for defendants. (Logan-Fla)

EMERGENCY MEASURES TO CONTROL EROSION AFTER A FIRE ON THE SAN DIMAS EXPERIMENTAL FOREST,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
R. M. Rice, R. P. Crouse, and E. S. Corbett.
US Dept Agr Misc Publ 970, p 122-130, 1965.

Descriptors: *Erosion control, *Check structures, *Demonstration watersheds, *Contour furrows, *Grasses, Soil erosion, Burning, Overland flow, Slope stability, Terracing, Barley, Watershed management, Rain, Peak discharge.
Identifiers: *Contour trenches, *Stabilization, *Annual grasses, San Dimas Experimental Forest.

After the 1960 fire, 20 experimental watersheds were given various erosion control treatments. From measurements made during four moderate sized storms in the 1962 hydrologic year it was concluded that side slope stabilization by contour furrow planting with barley was the most effective treatment. Because of its low cost, broadcast sowing of annual grass was also recommended. Contour trenches were found to be unsatisfactory because terrain and storm size made underdesign inevitable. Seeding of perennial grass was followed-up with herbicide to affect a conversion. This treatment resulted in very little vegetation and [illegible] celerated runoff and erosion. (Authors)

TRANSIENT CONTROL IN THE LOWER SACRAMENTO RIVER,
California State Dept. of Water Resources, Sacramento.
Fred J. Gientke.
Pap, Tech Memo No 39, Dep Water Resour, State Calif, Sept 1968. 36 p, 13 fig, 11 ref, 2 append.

Descriptors: *Hydraulic transients, *Weirs, Transients, Forecasting, Unsteady flow, *Gate control, *Gates, Automatic control, Control, Flow profiles, *Flood control, Hydraulics.
Identifiers: Sacramento River (Calif), American River (Calif), Transient flow.

During periods of high water on the Sacramento River, the City of Sacramento is protected by opening the gates of the Sacramento Weir, located several miles above the city. The transient-controlling gate and valve stroking concept was used in developing the plan of operation. Basic unsteady-state equations used in calculating river profiles during flood periods are given. A method for selecting a compatible dx and dt is discussed. System boundary conditions and methods for solving for system inflow and outflow are presented. The treatment assumes the availability of initial steady-state conditions in the conveyance system, providing background material that will be used for developing the technique for controlling transients in the Sacramento River. In addition to the Sacramento Weir, such a capability can be extended to the operation of the San Joaquin River, the lower San Joaquin River flood control project, and is being considered for operating various reaches of the California State Water Project. (USBR)

4B. Groundwater Management

THE RESEARCH OF FRESH WATER IN A SALINE ENVIRONMENT,
P. Lenk.
Int CONF on Water for Peace, Vol 2, p 862-868, 1968. 7 p, 3 fig, 1 ref. For 8-volume proceedings see Vol 2, No 9, 06B, W69-03305.

Descriptors: *Arid lands, *Alluvial channels, *Artificial recharge, Aquifer characteristics, Deltas, Groundwater recharge, Recharge wells, Underground streams, Coastal plains, Freshwater-saline water interfaces.

This paper describes procedures for coastal plains and river delta freshwater search, and presents a method of recharge in arid zones. An example of water search in the horizontal aquifers near Karachi, Pakistan is outlined. A 'linear' survey was substituted for an 'areal' survey and a 'channel' of low velocity, decreasing downstream was discovered. Other examples of 'channels' of freshwater passing through underground salt water are presented from Dahomey and Eastern Pakistan. The causes of these 'channels' are not fully understood, but may depend on their low velocities. Slumping of alluvial formations in large deltas increases their gradient and their water collecting ability. Data show that no single sheet of water is present, but rather a multitude of 'channels', the independence of which disappears downstream as deposits of silt stop water movement. Water search is best accomplished by transverse lines of boreholes across the delta. Details of a recharging method are presented. (Sherbrooke-Ariz)

INCREASING THE INTENSITY OF DRAINAGE OF THE GROUND BY VACUUMING,
Ministry of Melioration and Water Resources Management (USSR).
I. V. Minayev, T. P. Gorezko, A. A. Vasil'yevskiy, and R. F. Lukoshko.
Soviet Hydrol: Selec Pap, Issue No 2, p 171-178, 1968. 8 p, 4 fig, 3 tab, 4 ref.

Descriptors: *Drainage, *Drainage systems, *Tile drainage, *Vacuum drying, Pumping, Aeration, Subsurface drainage, Drainage engineering, Model studies, Hydraulic models, Land management.
Identifiers: Vacuum soil drainage systems.

The application of artificial vacuum to tile drain systems to enhance water table lowering and to increase soil aeration was evaluated by laboratory tank and flume studies. Moisture content of wet soils can be reduced by increasing drain depth, reducing drain spacing, and by applying vacuum. The use of vacuum pumps can be less expensive than deepening drains or changing their spacing. (Knaap-USGS)

NEW THRUSTS IN GROUND WATER,
Geological Survey, Washington, D. C.
C. L. McGuinness.
Ground Water, Vol 7, No 2, p 7-10, Mar-Apr 1969. 4 p, 2 ref.

Descriptors: *Groundwater, *Aquifers, Forecasting, Water supply, Waste disposal, *Underground water storage, Fresh water, Groundwater recharge, Demineralization, Desalination, Water management (Applied), Systems analysis, Injection wells.
Identifiers: Saline ground water, Groundwater hydrology.

Four principal trends in ground water are apparent: (1) Increasing use will be made of ground water for domestic supplies. Geohydrologists must learn to evaluate quantitatively the water supply under conditions of maximum development. (2) Aquifers will be evaluated as possible storage media for surplus flood water, in place of dams and reservoirs. The key here is economics--optimum use of resources. (3) Saline aquifers will be viewed as sources of water supply. The cost curves of developing new supplies of fresh water are ascending while the cost curves for desalinization are declining, and inevitably they will cross. (4) With efforts to prevent stream pollution, aquifers will be considered as possible storage media for industrial and domestic waste effluents. Control is needed so that the effects of waste injection can be predicted, the technology for confining those effects as intended can be developed, and a basis can be provided for a rational decision as to whether waste injection or an alternative use of the chosen aquifer is best for the economy. A systems-analysis approach is needed to develop a working model of a given hydrologic and socio-economic problem from which quantitative answers can be given to water planners. (USBR)

URBAN WATER RESOURCES RESEARCH,
American Society of Civil Engineers, New York. Urban Hydrology Research Council.
M. B. McPherson.
Amer Soc Civil Eng Annu Prog Rep, 1968. 43 p, 4 fig, 3 tab, 38 ref, 11 append. L. S. Tucker, Director.
Work supported by OWRR, Dept of Interior. OWRR Contract No 14-01-0001-1585.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Systems analysis, *Surveys, Data collections, Hydrologic data, Model studies, Research and development.
Identifiers: *Urban hydrology, Urban water resources.

Activities in urban water resources research by ASCE in 1967-1968 are reported. The objective of the research is to provide guidelines for ititiating and expanding a program of long-range studies in urban water problems. Considerable attention was given to storm drainage to arrive at mathematical descriptions of the rainfall-runoff relationship, to predict pollution loads, and to develop methods of planning water quantity, quality, and drainage development. Data collection system design and data requirements are discussed. Systems analysis, statistical studies, and model studies are being initiated. Considerable attention was given to research needs in political, economic, social, legal, and related aspects of urban hydrology. Appendices contain technical and feasibility studies of modeling, flood damages, non-hydrological aspects, research needs, systems engineering, and economics. (Knapp-USGS)

James R. Gray, and Garrey E. Carruthers.
Agricultural Experiment Station, New Mexico State University, Bulletin 515, Nov 1966. 25 p, 1 fig, 14 tab, 1 append, 5 ref.

Descriptors: *Input-output analysis, *Economic impact, *Recreation, Sampling, Multi-purpose reservoirs.
Identifiers: *Reserve Ranger District of New Mexico.

This study determined how local industries in west-central New Mexico would be affected by an increase in recreational activities. A multi-purpose reservoir was proposed. Input-output analysis was used to determine how this project would affect the local industries. Included in the study are physical and economic descriptions of the reserve area. The results include a flow table of industry flows of goods and services, a table of technical coefficients which shows the monetary value produced or used in each sector per dollar of production, the economic impact of increased recreational activity, and the impact of increased activity on water and land requirements of local industries. A conclusion is given. The appendix illustrates the development of the descriptive model used in the input-output analysis. (Grossman-Rutgers)

SOIL TEMPERATURES UNDER FOREST AND GRASSLAND COVER TYPES IN NORTHERN NEW MEXICO,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
Howard L. Gary.
US Forest Serv Res Note RM-118, 1968. 11 p, illus.

Descriptors: *Temperature, *Vegetation effects, *Snow cover, *Snow management, *Watershed management, Soil environment, Cold regions, Frozen soils, Temperature control, Mountain forests, Coniferous forest, Weather data, Soil temperature, New Mexico.

Temperatures for selected soil depths (1.5 to 112 inches) under aspen, Douglas-fir, spruce-fir and grassland types on north- and south-facing aspects from 9,900 to 11,150 feet above m.s.l. are reported for 1 year. Plant cover type was more important in modifying soil temperature than aspect, elevation, or snow cover. Average annual temperature for the first 12 inches of soil ranged from 33.2 deg F on the north-aspect spruce-fir at 11,150 feet to 40.8 deg F on the south-aspect aspen at 9,900 feet. Depth of freezing temperatures during the period of snow cover ranged from 1.5 to 3 feet. (Author)

RESEARCH ON GROUND-WATER CONTAMINATED BY DEPOSITS OF SOLID WASTE,
Hessiches Landesamt fuer Bodenforschung, Wiesbaden (West Germany).
Arthur Golwer, and Georg Matthess.
Symp on Geoche, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 129-133, 1968. 5 p, 4 ref.

Descriptors: *Waste disposal, *Waste dumps, *Leaching, *Path of pollutants, Biodegradation, Degradation (Decomposition), Sorption, Reduc-tion (Chemical), Oxidation, Municipal wastes, In-dustrial wastes.
Identifiers: Surficial solid waste disposal.

The effects of solid waste disposal practices on groundwater quality was studied at large municipal and industrial disposal sites. Leaching causes a rise of dissolved organic and inorganic material in groundwater. The organic components are rapidly degraded by soil microorganisms. Anaerobic con-ditions caused by degradation of organic wastes cause reduction of dissolved inorganic wastes in a zone of only a few meters width immediately downstream from the disposal site. In this zone, dis-solved iron concentrations as high as 21 ppm have been measured. Most inorganic contaminants are sorbed within a short distance of their sources, limiting the zone of groundwater contamination to definite boundaries. (Knapp-USGS)

THE EFFECT OF CATION-EXCHANGE CAPACITY ON THE RETENTION OF DIQUAT AND PARAQUAT BY THREE-LAYER TYPE CLAY MINERALS: 2. PLANT AVAILABILITY OF PARAQUAT,
North Carolina Agricultural Experiment Station, Raleigh.
J. B. Weber, R. C. Meek, and S. B. Weed.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 382-385, May-June 1969. 4 p, 3 fig, 13 ref.

Descriptors: *Adsorption, *Herbicides, *Clay minerals, *Phytotoxicity, Soil chemical properties, Organic compounds, Montmorillonite, Kaolinite, Ion exchange, Dequat, Paraquat.
Identifiers: Vermiculite.

Paraquat was adsorbed on varying amounts of Ca-montmorillonite and Ca-vermiculite. The herbi-cide-treated clays were added to a synthetic soil medium and cucumber seedlings were planted. Ca-montmorillonite effectively reduced the activity of approximately 90 to 95% of the adsorbed paraquat leaving only 5 to 10% available to the plants. Ap-proximately 10% was also found to be exchangea-ble using .005 N solutions and is believed to be that which is adsorbed on external surfaces. The results are analogous to those found with other montmoril-lonites and suggest that the major portion of dipyridinium herbicides that are adsorbed on this clay mineral is probably adsorbed in a biologically unavailable form. Ca-vermiculite reduced the phytotoxicity of paraquat, but did not remove the phytotoxic effects completely. Substantial amounts of paraquat were also released from this clay mineral using salt solutions. The results are analogous to previous findings with kaolinite clay and suggest that the adsorption of this herbicide by soils in which vermiculite and kaolinite are the dominant clay minerals is probably largely in a biologically available form. (Knapp-USGS)

DETERMINATION OF ORGANOCHLORINE INSECTICIDES IN SOILS AND WATERS,
Wisconsin Univ., Madison.
H. B. Pionke, and G. Chesters.
Soil Science Society of America Proceedings, Vol. 32, No. 6, November-December 1968, 11 p, 82 ref, p 749-759. OWRR Proj B-016-Wis.

Descriptors: *Degradation, *Gas-chromatography, Insecticides.
Identifiers: *Organochloride insecticides, Volatization, Insecticide extraction.

Pertinent references on the determination of organochloride insecticides in soil and water samples are reviewed. The particular methods are chosen because of their applicability to heterogeneous systems which often provide problems due to coextraction of indigenous components. The review is divided into three principal sections, i.e., extraction of organochlorine insecticides from soils and waters, cleanup of soil and water extracts, and analysis of purified soil and water extracts. Criteria used in evaluating extraction procedures were based on methods of equilibrating the insecticide with the soil sample and the control of possible insecticide losses through degradation and volatization. In the section on cleanup procedures special attention is devoted to chromatographic methods, particularly column and thin-layer chromatography. A large portion of the methods of final analysis of purified extracts is given over to gas-liquid chromatographic techniques because of the preponderance of its use for insecticide determination. The gas-liquid chromatographic methods are discussed on the basis of peak resolution, detection and measurement of the insecticides, and confirmation of their identity. Thin-layer chromatographic, spectrophotometric, and other methods of determination of organochlorine insecticides in purified extracts are evaluated. (Pionke-Wis)

5C. Effects of Pollution

CHARACTERISTICS AND SIGNIFICANCE OF RESISTANCE TO INSECTICIDES IN FISHES,
Mississippi State Univ., State College. Dept. of Zoology.
Denzel E. Ferguson.
Southern Div Amer Fish Soc, Reservoir Fishery Resources Symposium, p 531-536, 1967. 12 ref.

Descriptors: *DDT, *Aldrin, *Dieldrin, *Endrin, Pesticides, Fish, Shiners.
Identifiers: *Pesticide resistance, Bluegill, Gambusia, Green sunfish.

Several species of freshwater fishes of the Mississippi Delta region exhibit resistance to a variety of pesticides. Populations of bluegill, green sunfish and golden shiners were found to be resistant to endrin, aldrin, dieldrin and toxaphene, but susceptible to DDT. Pesticide-resistant populations apparently develop as a result of intraspecific variations in tolerance; bioassays of fish from pesticide-free areas reveal rare individuals with high tolerances, suggesting preadaptive genetic mechanisms. Levels of resistance are apparently related to the chemical stability of the pesticide. Resistant populations may accumulate sufficient levels of pesticides to constitute a hazard to susceptible populations of organisms, including man. Several examples of pesticide-resistant fish and their effects on susceptible fish are cited. (Voightlander-Wis)

CHEMICAL FERTILIZERS ON LAKE WATERS (IN GERMAN),
Von Heinz Ambuhl.
Summaries in English and French. Gas- und Wasserfach, Vol 107, No 14, p 357-363, Apr 1966. 6 fig, 2 tab, 18 ref.

Descriptors: *Eutrophication, *Nutrients, *Lakes, Ponds, Fertilizers, Algae, Nitrogen, Phosphorus, Water pollution effects, Water pollution sources, Water pollution control, Oxygen balance, Sewage, Runoff.
Identifiers: Lake Lucerne, Fertilized fields, Subterranean drainage, Mechanical and biological purification, Switzerland.

The pollution of lakes and ponds is in a large part due to inorganic salts promoting algal growth and subsequent processes of decomposition. As revealed by studies of Lake Lucerne, a few parts per million of fertilizer salts, particularly phosphates, are sufficient to stimulate the growth of algae and upset the oxygen balance. A large fraction of eutrophying substances is brought to lakes from fertilized fields via run-off and subterranean drainage. The amount of phosphorus from these sources is equal to that supplied by the normal discharges of sewage; the amount of nitrogen delivered from fields exceeds that contributed by sewage. On the average, Swiss lakes receive 0.3 to 0.5 kg of phosphorus and about 45 kg of nitrogen per hectare, per year; the latter figure is derived from a very wide amplitude. This inflow of nutrients is sufficient to eutrophy lakes, but the only corrective measure available at this time is purification of the sewage by mechanical and biological methods eliminating plant nutrients. (Wilde-Wis)
W69-08668

EFFECTS OF TEMPERATURE AND BODY WEIGHT ON ENDOGENOUS NITROGEN EXCRETION IN THE BLUEGILL SUNFISH (LEPOMIS MACROCHIRUS),
Indiana Univ., Bloomington. Dept. of Zoology.
Jan Savitz.
J Fish Res Board Canada, No 26, p 1813-1821, 1969. 2 fig, 4 tab, 17 ref.

Descriptors: *Metabolism, *Nitrogen, *Temperature, Proteins, Sunfishes.
Identifiers: *Lepomis macrochirus, *Nitrogen excretion, Protein maintenance.

The protein maintenance level for a population of bluegill sunfish was estimated on a seasonal and yearly basis. Effects of temperature (range: 7.2 to 32.2 deg C) and body weight on endogenous nitrogen excretion (ENE) were determined by feeding a non-protein diet (glucose). Values of weight exponents in weight-metabolic rate relationship (log Y= log a+ b log W) were nearly identical for all temperatures. Mean rates of nitrogen excretion for two size groups of fish (10 and 100 grams) increased with rising temperature, with rates at 29 to 32 deg C being exceptionally high and significantly different from rates obtained at lower temperatures. No resistance adaptation was noted at high temperatures. Protein maintenance levels were estimated at 15.29 kilograms protein for summer (June-August) and 2.43 kilograms for any 30-day period from September through May, based on population of 6260 fish. The total (annual) maintenance level was estimated at 37.54 kilograms. Graphical data include body weight-metabolic rate relationships and maintenance nitrogen levels. Tabular data include nitrogen excretion rates at different temperatures and ENE rates by age group. (Voightlander-Wis)

EUTROPHICATION OF INLAND WATERS.
Water Pollution Research Lab., Stevenage (England).

Ministry of Technology Notes on Water Pollution, No 41, 4 p, June 1968. 1 fig, 2 tab, 12 ref.

Descriptors: *Eutrophication, *Nutrients, *Lakes, Oligotrophy, Sewage effluents, Nitrogen, Phosphorus, Detergents, Fertilizers.
Identifiers: *Assessment of eutrophication, *Utilization of nutrients, *Sources of nutrients, *Control of eutrophication, Inland waters, Algal nuisance, Algal blooms, Agricultural runoff, Nutrient removal, Lake Zurich, Lake Washington (Wash), River Lee, River Thames, Great Ouse, England, Switzerland.

Eutrophication is the natural aging of lakes, hastened by man's activities, which may give r such problems as taste and odor in water sup filter clogging, disappearance of game fish, ar terference with recreation. To quantitatively d the degree of eutrophication many methods m used: measurement of dissolved oxygen, rat oxygen depletion, biological productivity, t parency, nutrient level, and chlorophyll 'a' co of surface waters. Newly developed is a for bioassay involving culture techniques with s algal species for measuring the growth-prom properties of various waters and effluents. Fa necessary for algal growth have been studied, nitrogen and phosphorus believed to be the r nutrients controlling algal growth; they are als most prominent nutrients in sewage effluents fertilizers. The greatest single source of nitr and phosphorus in surface water is agricultur noff; however, much phosphate enters domestic sewage greatly enriched in recent by detergents. To control eutrophication nutr rich waters can be diverted, as in Lake Washin or nutrients removed from effluents. Phosp can be reduced using lime, ferric, or alum hydroxides; nitrate by microbial denitrifica and ammonia by air-stripping--all at conside cost and with limited success in eliminating problem. (Ketelle-Wis)

iptors: *Dieldrin, *Rainbow trout, Gas chro-graphy.
ifiers: Transfer studies, Physiological prepara- Uptake.

al workers have suggested that fish uptake of ticides, including dieldrin, occurs primarily e gills. Uptake of dieldrin by isolated gill-arch rations was studied, using three perfusates: rs solution, TC-199 (Difco), and heparinized a. Preparations were exposed to bath solu- of 1000 parts per billion dieldrin in ethanol on. Transfer of dieldrin from the environmen- ater occurred only when plasma protein or a lipoprotein was present as the perfusate. fer was passive. Authors suggest that dieldrin related insecticides diffuse through the gills ecome dissolved in the lipid portion of plasma rotein. Graphical and tabular data include gs of gas chromatograms and summary of ex- ental data. (Voightlander-Wis)

TING AND CALCIFICATION IN DAPHNIA NA,
Univ., Berkeley. Sanitary Engineering arch Lab.; and California Univ., Berkeley. ol of Public Health.
ld B. Porcella, Charles E. Rixford, and John ater.
ological Zoology, Vol 42, No 2, p 148-159, 969. 8 fig, 1 tab, 21 ref.

riptors: *Crustaceans, *Daphnia, *Calcium, tium radioisotopes, Gamma rays, Tracers, edesmus, Bacteria, Temperature, Magnesium, isotopes, Radioactivity, Chlorella.
ifiers: *Daphnia magna, *Molting, *Calcifica- Exoskeleton, Half-life, Genotype, Uniformity Illumination, Beta rays, Autoradiographs, nuclide uptake, Daphnia schodleri, Observed concept, Radionuclide concentration, Yttri- 0, Carapace.

fication in Crustacea is a process limited arily to deposition of calcium salts in the ex- eton. Strontium, chemically similar to calci- is accumulated by various organisms in rela- to the calcium concentration. Because one of adioactive isotopes of strontium (Sr-85) has a vely long half-life and is a gamma emitter, it is ble to study calcification by observing deposi- f Sr-85 at different intervals within a molting . Since almost all the calcium and strontium is ized in exoskeleton, a clear description of aspects of calcium deposition and molting e determined by using Sr-85 to study the ical and kinetic relationships of calcification ole Daphnia. A hypothesis based on growth and relating accumulation to chemical brium between environmental strontium and m and deposition sites in the exoskeleton is sted as explaining calcification. Any factor affects synthesis or growth, such as tempera- has a direct effect on the calcium accumula- ate. Total accumulation of calcium and stron- is directly related to water concentrations and ifferential binding of calcium and strontium. f Sr-85 as a tracer for calcium in the calcifica- rocess appears to fit the observations. CENTRATIONS OF THE NATURALLY URRING RADIONUCLIDES Ra-226, Pb-210 Po-210 IN AQUATIC FAUNA,
ne National Lab., Ill. Radiological Physics
rd B. Holtzman.
2nd Natl Symp on Radioecology, May 15-17, Ann Arbor, Mich. US Atomic Energy n, Doc CONF 670503, p 535-546. 6 fig, 2 tab, f. Available from Clearinghouse for Federal d Tech Information as CONF 670503.

iptors: *Radioisotopes, *Radium sotopes, *Lead radioisotopes, *Aquatic ls, Marine fish, Freshwater fish, Shellfish, Copepods, Hazards, Industries, Tracers, Calcium, Metabolism, Human population, Ecology, Food chains, Biota, Atlantic Ocean, Great Lakes, Pikes, Herrings, Pacific Ocean, Salmon, Clams, Oysters, Alaska, Perches, Age, Potassium radioisotopes, California.
Identifiers: *Polonium radioisotopes, *Concentrations, *Natural occurrence, Seals, Species, Fin whale, Sperm whale, Bone, Tooth, Muscle, Euphasiids, Euphausia pacifica, Anycholeuthis, Biosphere, Radon-222, Half-life, Lead-210-Bismuth-210-Polonium-210, Alpha particle, Life spans, Halibut, Flounder, Scotland, Tuna, Japan, Barrow, Whitefish, Kidney, Blubber, Strongylocentrotus purpuratus, Los Angeles, California, Meganyctiphanes norvegica, Alpha counter, Shell, Spines, Fluids, Soft tissue, Jaws, Anthropods, Exoskeleton, Liver, Cattle, Human bone, Human tissue, Caribou, Reindeer, Baleen, Mandible, Environmental dose, Cosmic rays, Eskimos.

Concentrations of radium-226 (Ra-226), lead-210 (Pb-210), and polonium-210 (Po-210), were determined in hard and soft tissues of freshwater and marine fish, shellfish, seals, whales, and in some dietary components of whales. Concentrations of Ra-226 at about 5 picocuries/100 gram bone ash and 0.2 picocuries/100 gram wet soft tissue were fairly constant among species. Concentrations of both Pb-210 and Po-210 in a given tissue were equal to or greater than those of the parent, Ra-226. In fish and seal bone, concentrations of Pb-210 and Po-210 were similar to those in human bone, about 15 picocuries/100 gram ash. Fish muscle contained about 0.2 picocuries Pb-210/100 gram wet, specific activities of Po-210 about 10-fold greater. Activities of both nuclides in soft tissues of clams, oyster, and squid were higher by one order of magnitude than in fish muscle. In bone and muscle taken from a fin whale, concentrations of these nuclides were similar to those in fish. By contrast, teeth from sperm whales had concentrations of Pb-210 one order of magnitude greater than those in bone of fin whales. Higher concentrations of Pb-210 in sperm whales seem correlated with those found in components of their diet--copepods, euphausiids, and possibly squid. (See also Vol 2, No 18, Field 5C, W69-07441). ENRICHMENT OF RADIOACTIVITY BY ARCTIC ECOSYSTEMS IN FINNISH LAPLAND,
Helsinki Univ. (Finland). Dept. of Radiochemistry.
J. K. Miettinen.
Proc 2nd Natl Symp on Radioecology, May 15-17, 1967, Ann Arbor, Mich. US Atomic Energy Comm, Doc CONF 670503, p 23-31. 6 fig, 4 tab, 14 ref. Available from Clearinghouse for Federal Sci and Tech Information as CONF 670503.

Descriptors: *Radioactivity, *Ecosystems, *Arctic, Cesium, Iron, Radiochemical analysis, Food chains, Lichens, Freshwater fish, Flood plains, Pastures, Milk, Strontium radioisotopes, Calcium, Potassium, Fallout, Iron, Nutrients, Aquatic populations, Pikes, Lakes, Lead radioisotopes, Arctic Ocean.
Identifiers: *Finnish Lapland, Reindeer, Body burdens, Whole body counting, Polonium-210, Blood, Half-life, Sedges, Horsetails, Cows, Fodder, Caribou, Helsinki, Finland.

Body burdens of cesium-137 for reindeer Finnish Lapps and a control group of southern Finns were determined by whole body counting and by radiochemical analyses of blood samples for iron-55 and polonium-210. While body burdens of the southern population are of the same order as those of western peoples in general, Lapps contain about 50-fold more cesium-137 and 10-fold more iron-55 and polonium-210, due mainly to their food chains: lichen to reindeer meat to man; for cesium-137, fresh water fish to man, and flooded riverside pastures to cow's milk to man. In many Lapland lakes, potassium content is so low that enrichment of cesium-137 by aquatic organisms is greatly increased. Cesium-137 content in pike in 1965 varied from 0.2 to 22 nannocuries per kilogram fresh-weight as a function of potassium content of the lake water, and similarly in cow's exclusive fodder (water plants, sedges and horsetails) content of cesium-137 varied 100-fold. Cow's milk and meat in Lapland contain about ten times more cesium-137 than in southern Finland. Stable iron in Finnish lakes from 30 to 1500 micrograms per litter, effecting more than 10-fold differences in content of iron-55 in fish. (See also Vol 2, No 18, Field 5C, W69-07441). (Jones-Wis)
W69-08680

INTERACTIONS OF IONIZING RADIATION, SALINITY, AND TEMPERATURE ON THE ESTUARINE FISH, FUNDULUS HETEROCLITUS,
Bureau of Commercial Fisheries, Beaufort, N.C. Radiobiological Lab.
J. W. Angelovic, J. C. White, Jr., and E. M. Davis.
Proc 2nd Natl Symp on Radioecology, May 15-17, 1967, Ann Arbor, Mich. US Atomic Energy Comm, Doc CONF 670503, p 131-141. 5 fig, 4 tab, 22 ref, disc. Available from Clearinghouse for Federal Sci and Tech Information as CONF 670503.

Descriptors: *Radioactivity, *Salinity, *Temperature, *Fish, *Estuaries, Sodium, Oxygen demand, Cobalt radioisotopes, Mathematical models, Time, Regression analysis.
Identifiers: *Fundulus heteroclitus, *LD-50, Efflux, Radiation dose, Osmoregulatory system, Multiple regression analysis.

Estuarine animals are characterized by capacity to adapt to widely varying conditions. The interactions of salinity, temperature, and ionizing radiation as environmental factors affecting mortality, LD-50 (lethal dose for 50% mortality), and sodium-22 efflux of the euryhaline fish, Fundulus heteroclitus, were determined in a series of experiments. Multiple regression analyses were used to derive equations describing effects of all factors that significantly influenced mortality of the fish at three different intervals after irradiation. Temperature effects were significant at all three intervals, and effects of salinity, radiation dose, and temperature-salinity interaction were each significant at one or more of the different times after irradiation. Various combinations of different levels of temperature and salinity yielded different LD-50 values. At the upper end of their temperature range, fish tolerated more radiation at low salinity. At the lower end of their temperature range, this tolerance was reversed. Irradiated fish generally lost sodium-22 more rapidly than unirradiated fish, suggesting that lethal effects of radiation may stem from damage to osmoregulatory capabilities. Gills being vital in regulation of salt and water balance, damage to them could explain inability of irradiated fish to exist at certain temperature-salinity combinations. (See also Vol 2, No 18, Field 5C, W69-07441). (Jones-Wis)

IMPLICATIONS OF RADIOECOLOGY FOR OTHER RESEARCH IN ENVIRONMENTAL CONTAMINATION,
North Carolina State Univ., Raleigh. Inst. of Statistics.
Don W. Hayne.
Proc 2nd Natl Symp on Radioecology, May 15-17, 1967, Ann Arbor, Mich. US Atomic Energy Comm, Doc CONF 670503, p 32-38. Available from Clearinghouse for Federal Sci and Tech Information as CONF 670503.

Descriptors: *Radioecology, *Environmental sanitation, Dynamics, Food chains, Hazards, Fallout, Genetics, Tracers, Pesticides, Damages, Growth rates, Reproduction, Resistance, Carnivores, Trophic level, Domestic animals, Toxicity, Mammals, Birds, Population, Plants, Human population, Biota, DDT, North Carolina, Sampling, Monitoring, Distribution, Kinetics, Lipids, Mathematical models.

Identifiers: *Contamination, *Pollution, Cycling, Survival, Peromyscus, Patuxent Wildlife Research Center, Radionuclides, Biological magnification.

Radioecology has advanced understanding of what happens to material, natural or unnatural, introduced into the biological world and of unfavorable effects of long-term exposure at low levels. Distribution and occurrence of contaminants in food, water supplies, and gross aerial pollution must be studied and an attempt made to sample the world. Also needed is information bearing on kinetics of contamination including all processes whereby materials move within ecosystems, whether between cells of an organism, among organs and physiological pools of organisms, through food chains, or whether transported globally by physical means. In this regard, retention of DDT lipids of the body, apparently under conditions of dynamic interchange is illustrative. Author presents mathematical model for concentration in lipids. Another area for attention is individuals' response to toxicants. There is need of standardized tests of chronic effects on important biological parameters of growth, reproduction, survival, and behavior. Effects of radiation on populations also need study. Strongest argument for laboratory investigation of individual response is the possibility of predicting effects expressed as body burdens or storage concentrations. When field observations can demonstrate such concentrations, interpretation of effects can be made. (See also Vol 2, No 18, Field 5C, W69-07441). (Jones-Wis)
W69-08682

THE SCIENTIST'S RESPONSIBILITY IN THE CONTROL OF MAN'S ENVIRONMENT,
Chet Holifield.
Proc 2nd Natl Symp on Radioecology, May 15-17, 1967, Ann Arbor, Mich. US Atomic Energy Comm, Doc CONF 670503, p 1-8. Available from Clearinghouse for Federal Sci and Tech Information as CONF670503.

Descriptors: *Environment, Pollutants, Nuclear powerplants, Ecology, Fallout, Nuclear explosions, Uranium radioisotopes, Mining, Public health, Effluents, Generators, Water pollution, Costs, Energy, Radioactive wastes, Radioactive waste disposal.
Identifiers: *Scientist's responsibility, Peaceful applications, AEC National Laboratories.

Author discusses ecological issues, especially effects of nuclear explosives on ecosystems from Panama Canal to northern coasts of Alaska and effects of fallout--the Eskimo's problem of body burden accumulations via food chain. Peaceful applications of nuclear explosives demand consultation with ecologist. Uranium miners' exposure to radiation still requires solution. Citizens' revolt against pollution of their environmental demands corrective action. Data affecting health and welfare must be obtained. Remedial action is being slowly instigated. Administrators using results of research must use them properly as improper impressions or conclusions may lead to unsuitable decisions by laymen. Use of nuclear energy may reduce pollution since effluents can be controlled in large measure. Low cost energy from nuclear power plants can be used to purify and reclaim water supplies. Given this clean energy in abundance, railroads could be electrified, sewage pasteurized, cities centrally heated and refrigerated, and almost every urban service fulfilled without pollution. Energy should be considered more in urban planning, even the location of reactors in the heart of cities. Although quantities of nuclear waste would have to be stored, techniques are now being refined for disposal, including storage in salt mines. (See also Vol 2, No 18, Field 5C, W69-07441). (Jones-Wis)

Bioenvironmental and other studies are in progress to evaluate feasibility, from viewpoint of radiological safety, of plans for nuclear excavation of a sea-level canal across the isthmus of Central America. In order to predict external and internal radiation doses to human populations near proposed canal routes, field studies of human, agricultural, forest, freshwater, and marine ecology, have been undertaken in eastern Panama and northwestern Colombia. Results of these studies will be combined with predictions of radionuclide production and initial fallout distribution, for estimating radionuclide transfer through tropical food chains and other environmental pathways leading to man. Estimates will be made of types and quantities of radionuclides to be expected, during and after nuclear excavation, in the external environments and diets of native populations in different parts of two study areas, with calculations of potential radiation doses to man based on these estimates. Due to the nature of the problem, it has been necessary to make broad ecological studies of a fundamental nature. This paper reviews these studies and demonstrates that assessment of potential radiological hazards is dependent upon accumulation of ecological and biogeochemical data and application of radioecological principles. ptors: *Insecticides, Sediments, Adsorption, dation, Pesticides, Public health.
iers: *Lake sediments, *Gamma-BHC, hion, Environmental pollution.

sed usage of insecticides has led to the accu- on of residues in the environment, thus g a potential health hazard for fish, wildlife, mans. The problem is especially acute in stems as it leads to the possible pollution of g water supplies. All of these factors have itated the evaluation of the persistence and insecticides in the environment. In spite of ct that pesticidal pollution of natural es has been studied over a decade many of the problem are still unexplained, e.g., the rm effect of pesticides on the quality and ity of water resources. There are principally three ways by which a pesticide may reach the aquatic environment: (1) runoff from land amended with pesticides, (2) direct application or drift from adjacent spraying, and (3) recharge from contaminated aquifers. After introduction of the pollutant (pesticide) in the environment, its fate is then governed by the physical and chemical characteristics of the compound. If the pesticide remains in true solution, it can remain intact or can be degraded chemically and/or biologically. However, if the compound is adsorbed by the sediment, the pesticide may be detoxified by rendering it unavailable or its rate of degradation may be changed considerably. If the electronic configuration of the molecule is changed by adsorption the rate of degradation of the pesticide is likely to be increased. Conversely, if adsorption results in localization of the pesticide in places inacessable to agencies responsible for its degradation, the rate of degradation may be greatly curtailed. The experiments described in this thesis were initiated to determine the rates and pathways of gamma-BHC and parathion degradation in artificial lake systems. (Author)

ADSORPTION AND DESORPTION OF INORGANIC PHOSPHORUS BY LAKE SEDIMENTS IN A 0.1 MOLAR SODIUM CHLORIDE SYSTEM,
Wisconsin Univ., Madison.
J. D. H. Williams, J. K. Syers, R. F. Harris, and D. E. Armstrong.
Univ of Wisconsin Water Resources Center Report, June 1969, 17p. OWRR Proj B-022-Wis.

Descriptors: *Phosphorus, Sediments, Lake soils, Calcareous soils, Adsorption.
Identifiers: *Lake sediments, *0.1 Molar sodium chloride system, Non-calcareous soils.

Non-calcareous lake sediments generally adsorbed and retained more added inorganic phosphorus than calcareous lake sediments. Sediments which retained the most added phosphorus during adsorption tended to release the least phosphorus during a subsequent desorption at all levels of added phosphorus. The net amount of added phosphorus adsorbed (following adsorption and desorption) was lowest for calcareous sediments, with one exception, at the highest level of added phosphorus (50 micrograms phosphorus/milliliter). The reactions involved in the adsorption and desorption of added phosphorus were not always completely reversible during the time-periods used in the experiment. A close relationship was found between the order of the capacity of a sediment to retain added phosphorus in the laboratory and the levels of native total phosphorus and inorganic phosphorus in the sediment. (Williams-Wis)

FRACTIONATION OF INORGANIC PHOSPHORUS IN LAKE SEDIMENTS: I. RELEASE AND RESORPTION OF PHOSPHORUS DURING FRACTIONATION,
Wisconsin Univ., Madison.
J. D. H. Williams, J. K. Syers, D. E. Armstrong, R. F. Harris, and D. E. Spyridakis.
Univ of Wisconsin Water Resources Center Report, June 1969, 12p. OWRR Proj B-022-Wis.

Descriptors: *Phosphorus, *Distillation, *Wisconsin sediments, Calcareous-soils.
Identifiers: *Inorganic phosphorus fractionation process, *Lake sediments, Southern Wisconsin, Non-calcareous sediments, Resorption.

Procedures for characterizing the forms of inorganic phosphorus in lake sediments are discussed. Sediments were treated with an ammonium reagent containing added inorganic phosphorus to determine the recovery of phosphorus in this and subsequent stages of an inorganic phosphorus fractionation procedure. Total recovery of added phosphorus was 95 plus or minus 8 percent for nine calcareous sediments from southern Wisconsin. All of the phosphorus added to the non-calcareous sediments was recovered in the ammonium and succeeding first sodium hydroxide extracts. In the case of the calcareous sediments added phosphorus was recovered in the first hydrochloric acid, citrate-dithionite-bicarbonate, ammonium sub four fluoride, and second hydrochloric acid extracts, in declining order of importance. Recovery of added phosphorus in several extracts indicates that the interpretation of fractionation results is seriously complicated unless resorption of phosphorus released from the sediment during the extraction is corrected. Resorption can be largely corrected for when fractionating the inorganic phosphorus of non-calcareous but not of calcareous sediments. Little influence of state of sample on percentage recovery values was detected. (Williams-Wis)
W69-09019

FRACTIONATION OF INORGANIC PHOSPHORUS IN LAKE SEDIMENTS: II. FORMS AND AMOUNTS OF INORGANIC PHOSPHORUS,
Wisconsin Univ., Madison.
J. D. H. Williams, J. K. Syers, D. E. Armstrong, R. F. Harris, and D. E. Spyridakis.
Univ of Wisconsin Water Resources Center Report, June 1969, 11 p. OWRR Proj B-022-Wis.

Descriptors: *Phosphorus compounds, *Wisconsin, *Distillation, Phosphorus, Sediments, Calcareous soils.
Identifiers: *Lake sediments, Southern Wisconsin, Non-calcareous sediments.

The forms and amounts of inorganic phosphorus in five non-calcareous and nine calcareous Wisconsin lake sediments were determined using a recently developed fractionation scheme. Total phosphorus ranged from five hundred and eighty to six thousand and ninety parts per million and was usually lower in the calcareous sediments. The proportion of acid-extractable calcium phosphate was higher in the calcareous sediments; with one exception, this fraction constituted eight percent or less of total inorg. phosphorus in the non-calcareous sediments. Only for the calcareous Lake Wingra sediments did easily-soluble phosphorus (ammonium sub four chloride phosphate) exceed five percent of total inorg. phosphorus. The ammonium sub four fluoride phosphate and first sodium hydroxide phosphate fractions were low in the Wingra samples but constituted a higher proportion of total inorg. phosphorus in the others. Over eighty percent of total inorg. phosphorus in two non-calcareous sediments, which were highest in total phosphorus, was present in the first sodium hydroxide extraction. Low values for reductant-soluble phosphorus were obtained for the non-calcareous sediments; the higher values for this fraction in calcareous sediments are thought to be due to the release of inorganic phosphorus adsorbed by carbonate matrices. The second sodium hydroxide phosphate and residual inorg. phosphorus fractions were low in all samples. Values for ammonium sub four fluoride phosphate in the calcareous sediments were affected by state of sample (undried, freeze dried, and air dried). The sum of ammonium sub four fluoride phosphate plus first sodium hydroxide phosphate was independent of sample state and the values for ammonium sub four fluoride phosphate were affected appreciably by sample pretreatment for non-calcareous samples only. Reductant-soluble phosphorus values were influenced by state of sample in some cases. (Williams-Wis)

DILUTE SOLUTION REACTIONS OF THE NITRATE ION AS APPLIED TO WATER RECLAMATION,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
Frank C. Gunderloy, Jr., Cliff Y. Fujikawa, V. H. Dayan, and S. Gird.
Robert A. Taft Water Res Center Rep No TWRC-1, Oct 1968. 67 p, 14 tab, 232 ref, append.

Descriptors: *Denitrification, *Water chemistry, *Sewage treatment, *Chemical degradation, Nitrates, Ammonia, Reduction (Chemical), Oxidation, Phosphates, Iron compounds, Sulfates, Catalysts, Copper compounds.
Identifiers: Inorganic denitrification.

A new and unexpected partial denitrification of dilute nitrate ion solutions (10 to 50 ppm) was achieved by treatment with 8 moles of ferrous sulfate per mole of nitrate in unbuffered alkaline reactions. The nitrogen loss, which probably represents evolution of nitrogen or nitrous oxide was as high as 50%. Total reduction to lost nitrogen plus nitrate and/or ammonia approached 100%. The reduction takes place in the presence of partially oxidized black iron hydroxides, and requires catalytic quantities of cupric ion. Denitrification is suppressed by phosphates, as well as by several other factors, some as yet unidentified. Silver ion catalysis or a 16-fold excess of the ferrous salt permits reduction to ammonia in the presence of phosphate, but there is no accompanying denitrification. (Knapp-USGS)

Descriptors: *Water supply, *Water resources development, *Water resources, *Water quality control, Waste water treatment, Water demand, Water pollution control, Water treatment, Sewage treatment, Sewers, Analytical techniques, Filtration, Coagulation.
Identifiers: *Romania.

The water needs for industry, agriculture and domestic uses in Romania are expected to show a great increase in the future. Examples of recent plans of water resources and development in the country are briefly discussed. Flood control, construction of new lakes and reservoirs, development of new methods for controlling the water quality, control of pollution, and construction of waste treatment plants are only some of the problems which get more and more attention in Romania. Water filtration, decantation, and coagulation, uses of new technological processes, etc., are part of a new and coordinated research and development program. The waste treatment plants need to be modernized and staffed with highly qualified personnel. There is also an obvious need for development of new waste treatment plants and for a better geographical distribution in accordance with industrial and population growth. Above all, water quality and not quantity seems to be the control problem which requires adequate solutions from hydrologists. (Carstea-USGS)

STRUCTURE AND VALUES IN LOCAL POLITICAL SYSTEMS: THE CASE OF FLUORIDATION DECISION,
Chicago Univ., Ill.; and State Univ. of New York, Buffalo.
Robert L. Crain, and Donald B. Rosenthal.
(National Opinion Research Center reprint, University of Chicago) Journal of Politics, Vol 28, No 1, Feb 1966. p 169-195.

Descriptors: *Local governments, *Fluoridation, Decision-making, Surveys, Social values.
Identifiers: Community structure.

Previous studies of fluoridation controversies have been limited to analysis of only one city or at most a small number of cities. The research reported here was designed to complement these earlier studies with an analysis which was: (1) frankly political in approach, and (2) based on a large number of cases. Questionnaires were mailed to the local public health officer, the city clerk, and the publisher of the largest newspaper in each of 1,186 cities; 1,051 of these were cities between 10,000 and 500,000 population which (a) did not have fluoride naturally present and (b) were the primary consumers of their water supply. (This excludes many suburbs.) The remaining 75 cities were cities between 5,000 and 10,000 population which had held referenda. From the responses to the questionnaires, it was concluded that fluoridation has the following political properties: (1) it has almost unanimous support among the elite; (2) very few members of the elite have a strong interest in seeing it adopted; (3) the opposition comes from an organized minority, usually including chiropractors, Christian Scientist, natural food faddists, and, in a few cases, the radical right; (4) the public at large is uninformed but is cautious because of the possible side effects of any medical innovation; and, (5) the medical profession is virtually unanimous in support of fluoridation. While each of these statements requires a slight qualification, the general implications seem clear. Fluoridation can be adopted only by cities in which the political and civic elites' mild support is sufficient to offset the virulent opposition of a minority or ordinary citizens, and only when it is possible to keep bounds on the level of public discussion so that the argument does not escalate into a confused debate involving large numbers of the general public. POLICIES FOR EFFECTIVE AND ECONOMIC CONTROL OF THE ENVIRONMENT,
Wisconsin Univ., Madison.
I. K. Fox.
Paper presented at the Executive Management Seminar, Washington, D.C., February 7-9, 1969. 22 p.

Descriptors: *Community development, Waste disposal, Planning, Environmental effects, Municipal wastes, Industrial wastes, Rural areas, Preservation.
Identifiers: *Environmental contamination, *Waste management, *Economic control.

This paper is concerned with the physic
biological environment of man and the infl
of waste disposal practices, incidental cont
tion and development upon this environme
vironmental problems arise because
economic activities impose costs or damag
others, many of the effects are difficult to m
in quantitative terms, and numerous uncert
exist as to the nature and significance of so
vironmental effects. Environmental problen
be effectively studied in accord with the fol
classification of situations: (a) wastes and co
nants in urban-industrial areas; (b) patte
urban design; (c) the effects of contaminan
wastes on the biological environment; (d) de
tion of unique natural areas; (e) deteriorat
the countryside. Six policy directions ar
gested: (1) Foster regional systems for ma
wastes and contaminants; (2) Develop eco
incentives which encourage environmental p
vation; (3) Prohibit use of contaminants havi
certain long range consequences; (4) Ration
unique environmental areas; (5) Enlarge eff
preserve the rural countryside; (6) Make
provision for representing the general pub
decisions relating to the environment. (Autho

ECONOMICS OF REGIONAL WATER ITY MANAGEMENT,
ces for the Future, Inc., Washington, D.C.
Kneese.
re, Johns Hopkins Press, 1964. 215 p.

ptors: *Waste disposal, *Water resources, benefit analysis, *Cost allocation, Econo- f scale, Effluents, Groundwater, Hydrologic , Industrial water, Irrigation, Cities, g, Pollution, Public health, Water courses, Riparian rights, Streamflow, Reservoirs.
ers: *Ruhr region of West Germany, *Ohio Cost minimization, Land use planning.

ok is designed to shed light on how to deter- economically optimal region systems for ng water quality and how to devise ap- te institutional forms and tools for manage- f water quality. To achieve this purpose, e economic theory of resources allocation se studies of actual situations are used. An ction to the scientific and technological of water quality is included, followed by the cation of major waste materials entering urses and methods of treating both waste and water supplies. Following this discus- an outline of the economic resources alloca- tion theory as related specifically to waste disposal problems, and especially that of water pollution. The criteria of cost assessment and redistribution are applied to the water quality problem in the Ohio Basin. Regional waste disposal systems are then discussed as water quality control systems which are part of general water resources management and must be planned accordingly. The Ruhr area of West Germany is studied in this respect, previous to a survey of the implications of this area on present and future policy-making. (Murphy-Rutgers)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

OPTIMIZING CONJUNCTIVE USE OF GROUNDWATER AND SURFACE WATER,
Utah State Univ., Logan. Dept. of Civil Engineering.
James H. Milligan.
Utah State Univ Water Res Lab Rep, June 1969. 157 p, 19 fig, 19 tab, 60 ref, append. OWRR Proj No B-013-UTAH.

Descriptors: *Systems analysis, *Conjunctive use, *Surface waters, *Groundwater, *Utah, Mathematical models, Linear programming, Optimization, Stochastic processes, Probability, Planning, Water management (Applied), Water resources development, Computer programs.
Identifiers: *Conjunctive use optimization.

Mathematical models for groundwater and surface-water systems are formulated and solved on a digital computer using linear programming for optimizing the water use of the system. Post-optimal analysis, including sensitivity analysis of the objective function coefficients and right-hand side terms, is also applied to the models. The models which are developed include a general deterministic model, a general stochastic model in which hydrologic inputs are allowed to be probabilistic, and models of two simple, but real, river basins. The advantages of linear programming analysis are demonstrated by the computer solutions which can be obtained by this method of optimization. The method is shown to be effective as a guide to optimal water resources systems design and planning. (Knapp-USGS)

WATER RESOURCES SYSTEMS ANALYSIS,
North Carolina Univ., Chapel Hill. Natural Resources and Planning.
Maynard M. Hufschmidt.
Dept of Environ Sci and Eng, Pub No 138, Nov 22, 1966. 11 p, 1 tab, 11 ref.

Descriptors: *Systems analysis, Planning, River basin development.
Identifiers: *Sub-systems, *Typology.

The notion of comprehensive multi-purpose river basin planning implies a systems approach. A subsystem is a set of functionally related elements which can feasibly be analyzed as an entity, and which can be tied effectively to a larger system by means of well-defined links. Two broad classes of sub-systems are (1) physical-technologic, and (2) social-economic. A typology of sub-systems for water resources is developed. A listing of bibliographical references is included. (Grossman-Rutgers)

THE IDENTIFICATION PROBLEM AND THE VALIDITY OF ECONOMIC MODELS,
Simon Fraser Univ., Burnaby (British Columbia).
L. A. Boland.
South African Journal of Economics, Vol 36, No 3, p 236-240, Sept 1968. 5 p.

Descriptors: *Model studies, *Planning, Mathematical model, Economics, Costs, Benefits.
Identifiers: *Identification problem, Model validity, Model construction, Stochastic models, Exogenous variable, Endogenous variable.

The article is concerned with the benefits and costs of a particular aspect of the decision concerning the construction of an economic model. The author feels most econometricians implicitly ascribe to the conventionalist theory of knowledge, i.e., truth is only a matter of convention. He cites as proof of this the concern shown towards the problem of identification. The epistemological problem pertaining to the validity of the model is logically prior to the problem of identification. The solution to the identification problem amounts to the avoidance of a solution which remains invarient under transformations of the co-ordinates. The author thus concludes that the uniqueness property of identification implies a lack of invariance. Due to the importance of econometric analysis and econometric models in water resource planning and analysis this article should prove useful to empirical researchers in the water area. (Murphy-Rutgers)

OPTIMAL MATHEMATICAL MODELS IN PLANNING THE DEVELOPMENT OF A BRANCH AND IN TECHNICAL POLICY,
L. Kantorovich.
Problems of Economics, Vol 11, No 3, p 3-16, Jul 1968. 14 p.

Descriptors: *Mathematical models, Planning, Linear programming, Resources, Model studies, Depreciation, Demand, Prices.
Identifiers: *Branch models, *Branch management, Development, Technical policy, Optimal models, Nonlinearities, Indivisibilities, Multiproduct models, Output, Indices.

The return to the branch management of industry and its elevation to a new level create conditions favorable to the scientifically substantiated resolution of the problem of branch development. In this area, considerable use must be made of mathematical methods and models as well as the analysis and calculations based on them. At the present time widespread use is being made of the simplest optimal models of the development and location of branches; models calculated by linear programming methods and which in many cases are resolved on the basis of algorithms. The basic advantage of these models over the traditional system of isolated economic analysis for individual enterprises and of the balancing of production and demand is the complex approach in which there is a simultaneous joint analysis of the nation's total demand and of the production potentialities of all enterprises in a branch (existing and projected). This makes it possible to achieve an optimal combination of the interests of producers and consumers. These models can be applied to day-to-day planning of economic policy and management in the water resource area. (Loeb-Rutgers)

6B. Evaluation Process

WATER AND METROPOLITAN MAN, AN ENGINEERING FOUNDATION RESEARCH CONFERENCE,
William Whipple, Jr.
In Water and Metropolitan Man, An Engineering Foundation Research Conference, ASCE Urban Hydrology Research Council Summary, p 11-14, 1968.

Descriptors: *Social impact, Systems analysis, *Social needs, *Social values, Urban planning, Water resources development, Upstream, Downstream, Competing uses, Legal aspects.
Identifiers: *Interdisciplinary approach.

A multi-disciplinary approach to urban water resources development poses certain problems, including role conflicts and the status of the engineer vis-a-vis other disciplines. One of the most pressing legal problems in metropolitan water resources is the upstream-downstream situation. There is a need to codify much of the common law relating to water. The sustems approach to metropolitan water resources development is suggested as a method of achieving progress. Different objectives cause tensions in maximization processes because of the varying degree to which persons are benefited. Rational criteria for selection of projects is necessary; these criteria require the quantification and/or identification of impacts, direct and indirect. Determining the desires of society is often complicated by the fact that there are multiple interests. Reconciliation of these often conflicting needs require the development of a sophisticated methodology for measuring values and needs. (Starr-Chicago)
W69-08629

REFLECTIONS ON THE RELATIONSHIPS BETWEEN SOCIAL SCIENCE AND HYDROLOGICAL ENGINEERING,
Colorado State Univ., Fort Collins.
Duane W. Hill.
In Water and Metropolitan Man, An Engineering Foundation Research Conference, ASCE Urban Hydrology Research Council, Appendix D, p 87-90, 1968.

Descriptors: *Social change, *Social values, Social needs, Psychological aspects, Urban sociology, Water resources development, Aesthetics, Social impact, Decision-making, Research and development.
Identifiers: *Social costs, *Social benefits.

Since engineering facts have deep social consequences, the author contends there is no excuse for the failure of engineers and social scientists to collaborate in their research efforts. There is a need to know how engineering feats and technological transformation affect and direct the social system. The social scientists can be of the greatest help to the engineer in developing and refining measures for quantifying social values, social costs and social benfits. Eight critical needs for research are outlined: (1) information on how legal systems relate to and affect both engineering and/or social systems; (2) effects of both public and private decisions and a greater delineation between the responsibilities of the two sectors; (3) ways for consolidating water resource administration; (4) analysis of planning and planning behavior; (5) develop criteria for preserving engineering, safety and aesthetic values; (6) knowledge about the formulation and behavior of public and decision-making coalitions; (7) knowledge about the roles and impacts of those roles or urban hydrology in the model city programs; and (8) knowledge about what motivates publics and their decision makers. (Starr-Chicago)
W69-08631

SOCIOLOGICAL AND SOCIAL PSYCHOLOGICAL FACTORS RELATED TO METROPOLITAN WATER RESOURCES DEVELOPMENT,
Utah State Univ., Logan.
Wade H. Andrews.
In Water and Metropolitan Man, An Engineering Foundation Research Conference, The ASCE Urban Hydrology Research Council, Appendix C, p 79-86, 1968.

Descriptors: *Social change, Social needs, Social values, Psychological aspects, Urban sociology, *Water resources development.
Identifiers: *Community structure, Interdisciplinary studies.

The need for an interdisciplinary approach to metropolitan water resources development is acknowledged and the problem of communication between disciplines is seen as a real obstacle to the development of such an approach. Examples of sociological theory and analysis that could be applied to the problems of water are: values; social organization; social action; the process of diffusion of ideas; and research methodology. Values relating to one thing, as in the case of economic maximization may be outweighed by other values and choices cannot be made based on rational economic goals. Research on social organization and analysis of community structure and decision-making processes are useul for predicting social behavior. Social action has been studied by sociologists and a model containing five components has been identified. These components are: (1) convergence of interest; (2) establishment of an initiating set - including those with the right to initiate and those with the obligation to respond; (3) legitimation and sponsorship; (4) establishment of an execution set and mobilizing of community group resources; and (5) fulfillment of the objective of the initiating set - or carrying out of the programs. Urban water resources development is seen as being integrally connected with other social processes. All elements of an urban system must be related to any major resource development if archaic social and economic patterns are to be changed. (Starr-Chicago)

. IMPACT OF RESERVOIRS ON LAND UES: A CASE STUDY,
issippi State Univ., State College. Water urces Research Inst.
Williams, Jr., and D. L. Daniel.
pletion Report to the Office of Water urces Research, Department of Interior, June . 32 p. OWRR Proj No A-026-MISS.

riptors: Reservoir, Land values, Land prices.

study was deemed important due to the ber of reservoirs either being constructed or in lanning stage at the present time. The creation reservoir and the taking of land for purposes of ervoir ultimately cause changes in land usage land values. These changes are of interest to: hose whose land is acquired, (2) those whose use and/or value are directly or indirectly af- d, (3) the organization or agency responsible aking the benefit-cost analysis for the project, 4) the general public who must pay for many projects through taxes. For purposes of this , land prices were defined as market sales s and land values were defined as the capital- values of the income stream of land. Large in- es in land prices were found to have occurred e five years after the announcement of the voir site in a sample area near the reservoir. ever, multiple regression analysis indicated factors other than the reservoir may have played important roles in causing the high prices. The most important of these factors was proximity to and growth in a large city. Changes in values and prices of land which could be attributed to the reservoir occurred in areas where the reservoir caused a shift in land use. Little or no increases in the productivity of land occurred in existing uses of land. Productivity increases occurred when land use shifted. The characteristics of the reservoir and surrounding land areas in general determined the extent of changes in land use as a result of the reservoir. In this case, a buffer zone of about 18,000 acres was acquired with the reservoir. It is held by a public agency for controlled development. This factor limited the measurable effect of the reservoir on land values as determined through market forces. (Author)

THE ROLE OF RESEARCH AND OPTIMIZATION IN REDUCING THE COST OF HYDRO DEVELOPMENTS,
Bechtel Corp., San Francisco, Calif.
Harry Sutcliffe, and Michael D. Hayes.
Pap, Amer Soc Civ Eng Nat Meet Water Resour Eng, New Orleans, La, Feb 1969. 22 p, 6 fig.

Descriptors: *Hydroelectric power, Costs, *Optimization, Recreation, Pumped storage, Benefit-cost ratios, Technology, Research facilities, Research and development, Cost-benefit analysis, Electric power, Production, Economics, Reliability, Projects, Feasibility, Engineering, Investigations.
Identifiers: Pollution control, *Cost savings.

Areas in which improved technologies can control hydro development costs are examined. The changing role of the hydro project is discussed and areas for new research are suggested. The contribution of optimization technique in maximizing return to an owner is reviewed in the light of increasing pressures for more recreation, pollution control, and other nonrevenue-producing features. A wider benefit-cost ratio, that of benefit to the community as a whole rather than to the owner, must be optimized when considering a project. Sharing research data can benefit technology and reduce costs. The need for a domestic research center capable of testing turbines, pumps, valves, energy dissipators, and measuring large flows is discussed. (USBR)

REGIONAL GOALS AND THE PLAN.
Northeastern Illinois Planning Commission, Chicago, Ill.

IN Diversity Within Order, Northeastern Illinois Planning Commission, Chicago, Ill, March 1967, p 53-55.

Descriptors: Estimated benefits, Economic impact, Social mobility, Aesthetics, Parks, Economic efficiency, Land use, Water demand.
Identifiers: Chicago, Northeastern Illinois, Illinois.

Chapter V evaluates the Finger Plan for the Chicago metropolis on the basis of its achievement of economic, social, and physical regional goals. In terms of economic health, industrial sites should have good access to labor markets, and suppliers. In terms of social mobility, the improved mass transportation system will allow the poor to easily reach places of employment, as well as other facilities. In terms of physical attractiveness, health, and convenience of the region, parks and open spaces, are placed close to the concentration of population. Under the proposal plan, one can change jobs inside the region without having to move to a new home. The plan utilizes the surplus capacity of railways, thus keeping expense at a minimum. Linear development permits public utilities with excess capacity to be extended from established communities. In terms of optimum use of natural resources the plan provides large natural settings close to populated areas. The concentration of water demand may exceed ground water supplies, but the arrangement of population centers facilitates the use of Lake Michigan water. (Gossen-Chicago)
W69-08876

THE FINGER PLAN - A CONCEPT OF ORDER.
Northeastern Illinois Planning Commission, Chicago, Ill.

IN Diversity Within Order, Northeastern Illinois Planning Commission, Chicago, Ill, March 1967. p 15-39, 12 fig, 7 ref.

Descriptors: *Flood Plain Management, *Landfills, *Area redevelopment, Urban areas, Highways, Railroads, Public benefits, Industries, Conservation, Land use, Water storage.
Identifiers: *Chicago, Residential communities, Northeastern Illinois, Historic sites.

Chapter III describes the Finger Plan for the Development of the metropolitan six-county area of Chicago. Its development pattern resembles a hand whose palm is solidly urbanized and whose fingers form strings of communities. The skeleton of the hand is the transportation system featuring a complementary system of expressways, rapid transit rail lines, and commuter rail lines. Each finger is formed linearly by a passenger rail line and/or an expressway. Major regional centers of activity, i.e. universities, large hospitals, industrial parks, and shopping centers are regularly spaced along transportation systems of the palm and the fingers. Residential communities containing their own educational, neighborhood shopping, and recreation facilities fill out this skeleton. Major recreation parks, golf courses, cemeteries, agriculture, and large lot residential areas are located between the fingers. There are six principal development policies, relating to transportation, regional centers, open space, industry, residential communities, and natural resources. Each is discussed at length. Conservation of land, air, and water resources is recommended. Lands subject to flooding, poor drainage, and unstable soil conditions are unsuitable for urban use. Appropriate lands for refuse disposal sites, water storage sites, of special scenic or historic value, and of mineral deposits must be identified. (Gossen-Chicago)

ESTABLISHING PRIORITIES FOR PUBLIC INVESTME NTS,
Office of the Secretary of the Army, Washington, D.C. Systems Analysis Group (Civil Functions).
Jim J. Tozzi.
Systems Analysis Group (Civil Functions), Office Secretary of the Army, June 1969, Washington, DC. 21 p, 8 ref.

Descriptors: *Economics, *Investment, *Cost analysis, *Government finance, *Social participation, Area redevelopment, Water resources development, Project planning, Cost benefit analysis, Cost benefit ratio, Economic efficiency, Economic impact, Social values, Social aspects, Social impact, Social need.
Identifiers: Appalachian Water Resources Program, Objectives.

This paper proposes to outline a methodology which highlights, for any proposed investment, its contribution to the well-being of some groups, its detrimental effects on other groups and an alternative use of the same resources. This process, which is based on the establishment of priorities, consist of four steps: specifying the objectives to be attained; assessing the contribution the investment makes toward the fulfillment of each objective; as-

sessing the cost of the investment; and soliciting public reaction to the proposed investment. The execution of this process implies the need to make value judgments; judgments whose implications must be clearly presented to the general public. Each of the four steps is described with an emphasis on questions of economic methodology. In addition, each step is illustrated by examples from water resource investment projects. Among the salient conclusions were: the need to replace benefit-cost ratios with other indices which measure specific effects of investment; the complete identification of effects of public investment will likely cause changes in program content; and knowledge of effects of public investment will prevent the unequal or unfair distribution of benefits. WILL A LAKE AIRPORT BEST SERVE THE CHICAGO AREA.

Open Lands Project, Chicago, Sep 1968. 56 p, 3 illus, 3 append.

Descriptors: *Lake Michigan, *Water management, *Water pollution, *Recreation, *Social values, Oil wastes, Pollutants, Recreation facilities, Political aspects.

This report presents a number of arguments against the construction by the City of Chicago of a proposed large airport in Lake Michigan. Although this paper deals with many factors not related to water, a number of points is made regarding water management problems in an urban context. The following topics were discussed in detail: comparison of site costs, population growth factors, political implications, time schedule, construction problems, airport and runway orientation, air safety, noise hazards, ground traffic accessibility, air pollution, water pollution, effects on recreational boating, related commercial developments, and civic beauty. A number of conclusions related to water management was made. Construction of a polder-type lake airport would contribute to two types of water pollution assuming airport runoff is treated, pollution from aerosol-type exhause from jet aircraft, and pollution effects caused by the disruption of lake circulation patterns. Transportation causeways as well as the airport itself would be detrimental to recreation uses of the lake. Finally, the construction of an airport in Lake Michigan would seriously impair the value of the city's only unique natural resource. (Davis-Chicago)

ENVIRONMENTAL ASPECTS OF RIVER BASIN PLANNING,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
Maynard M. Hufschmidt.
J of the Hydraulics Div, Proc of the Amer Soc of Eng, Vol 93, No HY6, Proc Paper 5605, p 323-333, Nov 1967. 11 p, 21 ref.

Descriptors: *Resources, *Hydraulics, Rivers, Systems, Analysis, Cost-benefit analysis.
Identifiers: Environmental quality, Comprehensive planning.

Current methods and administration of river basin planning must be changed substantially to accommodate the increasing national concern for problems of environmental quality. Modifications will be required in planning theory: improvement of environmental quality should be adopted as a major national objective, along with the objectives of economic efficiency and income distribution. Changes are also needed in methods of computing benefits, cost and production functions, and in the planning process and techniques. Systems analysis methods must incorporate many environmental quality parameters and alternative development and management measures. Planning for river basins and for metropolitan areas must be integrated. Important changes required in water resources policy, organization and administration are discussed. (Grossman-Rutgers)

SOME DEVELOPMENT POTENTIALS OF THE NATURAL RESOURCES OF THE ATLANTIC COASTAL PLAINS,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
Maynard M. Hufschmidt.
Econ Dev Potentials of the Atlantic Coastal Plains Reg, Agr Policy Inst., North Carolina State Univ., Series 26, p 51-53, June 1967. 3 p, 1 ref.

Descriptors: *Conservation, Public benefits, Long-term planning, Project planning.
Identifiers: *Environmental quality, *Environmental deterioration.

Policy makers must be careful to ensure that economic development does not detract significantly from scenic, historic and environmental values. The absence of major mineral deposits in the region is to the advantage of the environmental quality of the region. Another resource issue relates to the value from both the regional and national point of view of preservation as ecological preserves of major portions of the swamps and estuaries of the region. Thirdly, there is the question of how high the quality of the environment should be maintained. Through rational planning principles and techniques a balance between development and preservation which will be for the long range benefit of the region and the nation can be achieved. RISK, IMPERSONALITY, AND THE SOCIAL WELFARE FUNCTION,
Delhi School of Economics (India).
Prasanta K. Pattanaik.
Jour Pol Econ, Vol 76, No 6, p 1152-1169, Nov/Dec 1968. 18 p, 1 fig, 1 tab, 17 ref.

Descriptors: *Welfare, *Risks.
Identifiers: *Individual preferences, *Subjective preferences, *Social welfare function, *Preference patterns, *Ethical preferences, Intransitivity, Expected utility.

The concept of 'ethical preferences' as developed by Harsanyi (1955) is persuasive enough to justify the qualification 'ethical', and it is the combination of risk and the 'extended sympathy' type of comparison which accounts for this persuasiveness. Ethical preferences can be used as the ingredients for deriving social preferences, and in some respects this procedure is more appealing than the Arrowian procedure of deriving social preferences from the individual's 'subjective preferences.' Granted that individual 'ethical preferences' can be represented by von Neumann-Morgenstern utility indexes this in itself does not solve the problem of aggregation, because 'ethical preferences' will not necessarily be identical for different individuals. The problem of reducing different individual's welfare indexes to a comparable basis is serious in view of the uniqueness only up to linear transformation of the von Neumann-Morgenstern indexes. No less serious is the fact that Harsanyi's 'ethical preferences' may not at all satisfy the von Neumann-Morgenstern or the Marschak axioms. The axioms of 'reduction of compound lottery' and of 'complete ordering' are particularly open to serious doubts of a type that does not arise with 'subjective preferences.' If a social welfare function could be satisfactorily derived, this condition would improve efficiency of decisions concerning allocation of resources, including water resources. (Sokol

The aim of this book, as of the Resource for the ture Forum on which it is based, is to bring exp opinion to bear upon a few resource problems wide interest and significance. Specifically, book seeks to shed light on some of the resou conservation problems of the next fifty years fr the vantage point of a critical review of the past ty. In using the past as a springboard for appaisi the present and future, hard questions arise and essays in this book explore some of them. For ample, what forces during the past fifty years ha shaped American concepts of conservation and titudes toward it. What have been the really imp tant issues and trends in land and water, miner and energy, outdoor recreation, and fish and w dlife management. How have resource develo ment policies and programs affected the natio economy, political life, and social structure--a vice versa. Most important of all, what guidan does the record of the past offer for the futu (Loeb-Rutgers)

MEASURING THE RATE OF RETURN C CAPITAL,
Sheffield Univ. (England).
A. A. Sampson.
Jour of Finance, Vol XXIV, No 1, p 61-74, M 1969. 14 p, 4 tab, 13 ref, append.

Descriptors: *Regression analysis, *Capital, Fina cial analysis, Profit, Time-series analysis, Lon term planning, Investment, Marginal productivity
Identifiers: *Distributed lag model, *Rate return, Cross section analysis, Discounted cas flow, Time profile, Price changes, Capital-lab ratio.

This paper presents the results of an attempt to es mate the rate of return on capital via regressi analysis of financial data. A model relating curre profits to current and lagged inflows of long-te capital is considered and fitted to a set of data fr the British Mechanical Engineering Industry. Bo time-series and cross-section data are use Acquisitions of long-term capital are measured summing depreciation provisions, retain earnings and receipts from issues of ordinary shar and instruments of long-term debt. The motivati behind the exercise described in this paper is a fe ing that microeconometric analysis might provi useful information about financial performances the industrial sector. The discounted cash-flow ra of return on capital is one of the most importa dimensions of financial performance, and increa ing emphasis is being placed on it in the literatu on management and decision-making. This a proach might be useful in determining the rate return on capital invested in water resource pr jects. (Author)

blems of cost sharing between federal agencies
etween grantor and grantee derive from the
that, generally, more than one public agency
contribute to the cost of a single project. At
two levels of government--federal and local--
share in a project's cost; often two or more
cies of the federal government will contribute
ne same project, and for different objectives.
ce, joint products and multiple objectives are
rent in the resource allocation decisions
ussed in the paper. Short of specific reorganiza-
to achieve this goal, the individual decision
er can only single out a few other agencies to
rdinate' with. In view of the fact that major in-
ependencies of this kind exist among recent
at Society programs, the possible losses due to
optimal behavior by government agencies
d be substantial, even more so now with total
ual expenditures for project oriented activities
approaching $17 billions. Therefore, attention
n to coordination of federal programs should
ude much more detailed empirical analysis
cted at establishing the best division of authori-
r sub-optimization. The above is especially ap-
able to the case of water programs which in-
e many interdependencies of efforts among
ernmental agencies at all levels. (Sokoloff-Rut-

NOMIC MEASURES IN THE RATIONAL
LIZATION OF WATER RESOURCES,
oiter.

Problems of Economics, Vol 11, No 3, p 33-44, Jul 1968. 12 p, 6 tab.

Descriptors: *Natural resources, *Water utilization, Water pollution, Economics, Water shortage, Water supply, Prices, Costs, Consumptive use.
Identifiers: *Economic measures, Economic reform, USSR, Quality.

The entire course of the USSR economic reforms presently being carried out poses the problem of increasing the effectiveness of utilization of the richest natural resources that the country has at its disposal. A necessary prerequisite of all measures and, in particular, of those aimed at the solution of this problem is the economic evaluation of natural resources being used at the present time and those which will be brought into economic circulation in the near future. Under these conditions, the search for and development of a methodological basis for the economic evaluation of natural resources is a natural phenomenon. Such a basis must be uniform for various types of natural resources and must by a kind of yardstick for concrete methods and ways of making economic assessments of them at the same time taking into account the specific features of the use of alternative natural resources. The author discusses the problem of water shortages in several regions of the USSR and the basic principles in the establishment of payments for the use of water resources. This later discussion, along with the general resource analysis of the paper may be of relevancy to water conservation and planning studies in this country. (Loeb-Rutgers)

SOME PROBLEMS OF CRITERIA AND ACQUIRING INFORMATION,
California Univ., Los Angeles, Calif.
Roland N. McKean.
IN Environmental Quality in a Growing Economy, Baltimore, The Johns Hopkins Press, 1966. p 61-65, 5 p, 1 ref. Henry Jarrett, Editor.

Descriptors: *Government, *Pollution, *Optimization, *Economic efficiency, Effluents, Erosion, Pollution, Taxes, Fish stocking, Subsurface water, Fisheries, Water supplies, Costs, Smog, Value, Input-output analysis.
Identifiers: *Externalities, *Public sector, *Private sector, Goods, Services, Steel, Marginal value, Noise abatement, Gains.

This article begins with the idea that action concerning an externality is appropriate only if gains promise to exceed costs, whatever value system is being used as criteria. Not to abolish an external cost would not, then, necessarily indicate a deviation from attainable optimality. As far as the decisions about actions to be taken by government are concerned, the author points out that judgments about many items may properly enter, since there is no fundamentally correct criterion in group decision making. Because of equity considerations, various efficiency boundaries in such decisions may be disputed, yielding legitimate disagreements about the nature of these boundaries and the prices to be attached to various goods and services. In considering gains/costs relationships, the cost of acquiring the relevant information should be considered, along with the cost of internalizing the externality. Both these processes can be so expensive as to be uneconomical and far from an improvement of the situation at hand, whether it be a question of noise reduction of pollution abatement. In both the public and private sector, the rights of certain individuals to resources and services are ill-defined, and decision-makers are restricted to 'groping in the dark.' Water resource analysts can use this article as a guideline for assisting their own decision-making process. (Murphy-Rutgers)

THE EFFECTS OF LOW-COST HYDRO POWER ON INDUSTRIAL LOCATION,
Manitoba Univ., Winnipeg.
Gunter Scramm.
Canadian Journal of Economics, II, No 2, p 210-229, May 1969. 20 p, 2 fig, 6 tab.

Descriptors: *Hydroelectric power, *Costs, Tennessee Valley Authority Project, Electricity, Industrial production, Magnesium, Aluminum, Technology.
Identifiers: *Hydropower, *Industrial location, Bonneville Power Administration, Canada, Power-intensive industries, Chemical pulp, Titanium sponge, Atomic power.

Past experience shows that the availability of low-cost hydro power can significantly affect the locational decisions of power-intensive industries. In the United States the developments of the Tennessee Valley Authority in the Southeast and the Bonneville Power Administration in the Northwest have led to large-scale settlements of such industries in areas which, with the exception of low-cost energy, generally offered neither suitable local raw materials sources nor nearby markets. Similar developments took place elsewhere. A main reason for Canada's and Norway's large export oriented electro-metallurgical and chemical industries are favorable hydro power sources in close vicinity to tidewater locations. The author examines whether the underlying cost-price relationships of these locational decisions are still valid for the present and the foreseeable future. This is a question of considerable interest to Canada because it is one of the few industrialized nations that still has substantial sources of undeveloped hydro power available. It is of great interest also to the undeveloped countries that are rich in hydro resources but unable to utilize them unless substantial industrial energy loads are developed at the same time. (Loeb-Rutgers)
